BUILDCHAT · MenúYA (semana 13) · josepferre

Conversación completa con Claude Code, en orden, del 02/11/2026 15:12 al fix de línea base (05/11/2026). Horas en CDMX. Incluye mensajes, comandos y resultados de herramientas. No incluye el razonamiento interno del modelo. Llaves y tokens aparecen como [REDACTADO]. Mensajes del usuario: 12 · Llamadas a herramientas: 139.

Usuario · 02/11/2026 15:12

Primero revisa que node sea v20 o mayor y que git esté instalado; si falta algo, dime cómo instalarlo y detente. Si todo está bien: mueve ~/Downloads/PACKET_W13.md a docs/PACKET.md, ~/Downloads/SESSIONS.md a docs/SESSIONS.md y ~/Downloads/BUILD_PROMPT.md a docs/BUILD_PROMPT.md (crea la carpeta docs si no existe). Confirma que están ahí. Luego lee docs/BUILD_PROMPT.md y síguelo de principio a fin, en orden.

Herramienta: Bash — Check node, git, and source files

```
node -v; git --version; ls -la ~/Downloads/PACKET_W13.md ~/Downloads/SESSIONS.md ~/Downloads/BUILD_PROMPT.md;
pwd; ls -la
```

Resultado

```
v24.19.0
git version 2.50.1 (Apple Git-155)

# MenúYA · Week 13 — Implementation prompt for Claude Code

You are building MenúYA's Week 13 slice, the "Contador de Ahorro". `docs/PACKET.md` is the spec: build only what
it describes. Work as autonomously as possible, and stop ONLY at the 🔴 points below.

## Hard rules
- **Never ask me for a password, and never type, print or commit a secret.** Logins happen in my browser through
each CLI's own login flow. Keys go only into `.env.local` (gitignored) and Vercel environment variables.
- The Supabase **service role key is never used in client code**. Use the anon key + RLS.
- Every table holding user data has **RLS ON** with policies on `auth.uid() = user_id`.
- Every form is validated with **zod** (types, lengths, ranges) and the DB has matching `check` constraints.
- All visible data is invented and labeled **"Datos de demostración"**. Prices are labeled **"Precio de
referencia (demo) · captura: dic 2025"**. Never show one "exact" total.
- UI text in Spanish (Mexico), mobile-first, simple.
- After each feature: run the app, check it compiles, commit with the message given, push. Update
`docs/DECISIONS.md` (date, decisions, tomorrow's first move).
- If a command fails twice, stop and show me the error.

## Feature 1 — Scaffold + first deploy
1. Next.js (App Router, TypeScript, Tailwind) in this folder. `.gitignore` includes `.env*`, `node_modules`,
`.vercel`.
2. Landing: "MenúYA — ¿Cuánto se te va en comida que tiras?", button "Empezar", label "Versión de prueba · datos
de demostración".
3. `docs/DECISIONS.md` created.
4. `git init`, commit: `chore: scaffold Next.js + Tailwind, landing, .gitignore`.
5. 🔴 **Pause for logins.** Check whether `gh`, `vercel` and `supabase` CLIs are installed (install with
npm/brew if not), then tell me to run, one at a time: `gh auth login`, `vercel login`, `supabase login`. Wait
until I say "listo".
6. Create a **private** GitHub repo `menuya` with `gh`, push.
7. Deploy with `vercel --prod`, link it to the GitHub repo. Give me the URL. → **Deploy 1**
8. 🔴 Ask me if I already bought a domain. If yes, add it with `vercel domains add` and show me the exact DNS
records I must set, if any.

## Feature 2 — Google sign-in + consent + RLS
```

1. Create a Supabase project with the CLI (region closest to Mexico). Generate a strong DB password yourself and store it ONLY in `.env.local`; don't show it to me.
2. Add `@supabase/supabase-js` and `@supabase/ssr`. Put URL + anon key in `.env.local` and in Vercel env vars (`vercel env add`, all environments).
3. 🔴 **Pause for Google OAuth.** Give me short numbered click-by-click steps to: (a) create an OAuth client in Google Cloud Console (type "Web application"), with the Supabase callback URL as authorized redirect URI; (b) paste the Client ID and Secret into Supabase → Authentication → Providers → Google; (c) add my Vercel URL and domain to Supabase → Authentication → URL Configuration. Wait for "listo". I paste secrets only into those dashboards, never here.
4. Migration `profiles`: `user_id uuid pk references auth.users`, `city text`, `grocery_band text check in ('<2500','2500-3500','>3500')`, `consent_at timestamptz`, `created_at`. RLS on.
5. Screens: "Entrar con Google" → privacy notice (plain Spanish, 2025 LFPDPPP, no mention of INAI; says what is stored, why, that ELCSA answers never leave the phone, how to delete data) → checkbox "Acepto" (stores `consent_at`). No other screen is reachable without consent.
6. Commit: `feat: Google sign-in + consent screen + profiles with RLS`.

Feature 3 — On-device ELCSA + comedores referral
1. Adult-household ELCSA (8 yes/no questions, last 3 months). One-line intro: "Estas preguntas existen para no venderte algo si no te alcanza. Tus respuestas no salen de tu teléfono."
2. Scoring **in browser memory only**: 0 = seguridad, 1–3 leve, 4–6 moderada, 7–8 severa. Never sent, never stored (no localStorage either). Only the event `elcsa_completed` with NO score is logged.
3. Moderate or severe → screen with CDMX comedores info and free resources, no price, no pay button anywhere in the app for that session.
4. Commit: `feat: on-device ELCSA + comedores referral`.

Feature 4 — Baseline + daily logs
1. Tables (RLS on, `user_id` default `auth.uid()`):
   - `baseline_orders`: `label check in ('antojo','no_planee','no_tuve_tiempo','alcohol_tabaco','otro')`, `amount_mxn int check 0..2000`.
   - `waste_logs`: `log_date date`, `item text check length 1..60`, `amount_mxn int check 0..2000`, `week smallint check in (1,2)`.
   - `impulse_logs`: `log_date date`, `kind check in ('delivery','oxxo','otro')`, `amount_mxn int check 0..2000`, `week smallint check in (1,2)`.
2. Baseline screen: label your last 10 orders (from your delivery app history).
3. Home: progress "X de 7 días registrados", two big buttons "🗑️ Tiré comida" and "🛵 Pedí algo / compra no planeada", today's entries list, and a "Registrar hoy" banner if nothing logged today.
4. zod validation with Spanish error messages.
5. Commit: `feat: baseline orders + waste/impulse logs with validation`.

Feature 5 — Saving screen + price trust + event log
1. `events` table: `user_id`, `name text check length ≤ 40`, `props jsonb`, `created_at`. RLS: insert/select own rows only. Log: `signed_in`, `consent_given`, `elcsa_completed`, `baseline_done`, `log_added`, `saving_viewed`, `pay_link_clicked`.
2. Saving screen: week 1 total vs week 2 total (waste + impulse), "Ahorro esta semana: $X de $60" with a bar. If below $60, say so honestly. Show the counts that plans can't fix (alcohol/tabaco) separately.
3. "Mi lista" page (price-trust fix): a static list of whitelisted basics only (frijol, tortilla, huevo, arroz, seasonal produce; no sealed products), each with a price range and capture date, and a total shown as **"Máximo esperado: $___"**, never one exact number. Label: "Precio de referencia (demo)".
4. Pay button (only if ELCSA screen didn't trigger): "Apoyar MenúYA · $149 por semestre, sin renovación automática" → opens a placeholder URL from env var `NEXT_PUBLIC_PAY_LINK` (I'll set the Mercado Pago link later). Logs `pay_link_clicked`.
5. Commit: `feat: weekly saving screen, price ranges, event log`, then `vercel --prod`. → **Deploy 2**

Feature 6 — Mechanical test pass
Run every test in PACKET.md section 11A that you can automate (RLS with a second test user, validation edge cases, no ELCSA data in network requests, saving math with seeded demo data, one event per action). Write results to `docs/TEST_RESULTS.md`. Fix at least one real bug found, commit `fix: <bug>`, redeploy. → **Deploy 3**

Then
🔴 Stop. Give me: the live URL, the GitHub link, a list of each screen in order (for screenshots for the persona test), and anything still pending.

Herramienta: Bash — Read spec and sessions docs

```
cat docs/PACKET.md; echo ======; cat docs/SESSIONS.md
```

# MenúYA · Week 13 PACKET — "Contador de Ahorro"

**Author:** Josep Ferré · **Role:** 🗡️ Adversary · **Venture:** MenúYA · **Week 13 — Real Humans**
**Status:** Packet before code. No code is written until this file is committed.

> Adversary framing: this week's slice is not the feature that makes MenúYA look good. It is the feature that can **kill** it. The 10:1 depends on one unproven number — a saving of **≥ $60 MXN a week** (waste + impulse spending). The Contador de Ahorro measures that number with real strangers, in pesos, without telling them what I expect.

---

## 1. Problem (in my words)
```

A foráneo living alone in CDMX buys groceries, throws part of them away, and then still pays for an OXXO run or a panic delivery around days 10–15 of the quincena. Nobody — not the user, not us — knows how many pesos that actually is. MenúYA's whole business case ($149 a semester ≈ 10:1) assumes it is at least $60 a week. If it isn't, there is no business, however nice the meal plan looks.

2. Exact user

An **employed foráneo, 24–30, living alone in CDMX**, who shops at a major supermarket chain (Soriana, Bodega Aurrerá, Chedraui, Walmart), spends roughly **$2,500–3,500 MXN a month on groceries**, and still orders delivery or makes unplanned purchases before payday.

Not this week's user: students spending $1,200–2,000 a month on food. They fall below INEGI's urban food basket ($2,590.61/month, Sept 2026) and the app refers them to CDMX comedores instead of selling to them.

3. Success definition

Before the module closes, a stranger can go from a Facebook/WhatsApp post to Google sign-in, consent, 7 days of logging, and a screen showing "this week you saved $X vs. $60" — with no help from me — and at least one stranger pays $149.

Measurable pass/fail bars (written before testing):

Test	Pass	Fail
Weekly saving (waste + avoided impulse)	≥ $60 MXN/week, week 2 vs week 1	< $60 → 10:1 does not hold
Logging adherence	7 of 7 days logged	Drop-off by day 3
Unassisted onboarding	0 price/consent questions, ≤ 2 usage questions	Any price/consent question
Willingness to pay	≥ 1 stranger pays $149	Nobody pays → 10:1 stays a hypothesis
Strangers	≥ 3 of 5 users are strangers	Friends-and-family testing

4. 🎨 Mockup (image-generated)

Prompt to paste into the LLM's image generator (save the result as `docs/mockup.png` and embed it here):

> Mobile app screen mockup, clean flat UI, Spanish text, warm green and off-white palette. App name "MenúYA" at top. Header: "Tu semana · 3 de 7 días registrados". Big card in the center: "Ahorro esta semana: $48 de $60" with a horizontal progress bar 80% full. Below it, two large one-tap buttons: "🗑️ Tiré comida" and "🛵 Pedí algo / compra no planeada". Under those, a small list "Hoy: 1 bolsa de espinaca ($28), 3 tortillas ($6)". Small grey label at the bottom: "Datos de demostración · precios de referencia Profeco QQP, capturados dic 2025". Bottom nav bar with icons: Plan, Lista, Ahorro, Perfil. iPhone frame, realistic, minimal.

`![Contador de Ahorro mockup](mockup.png)`

5. 📊 Flow

5a. Flowchart — how the Contador de Ahorro works

```mermaid
flowchart TD

        S3[Scores ELCSA locally, never sends it]
        S4[Saves logs with input validation]
        S5[Sends daily reminder]
        S6[Computes saving in pesos]
        S7[Writes events to event log]
    end
    subgraph F[Founder — Josep]
        F1[Recruits strangers in roomies groups]
        F2[Watches onboarding by screen-share, no help]
        F3[Counts questions asked]
        F4[Sends Mercado Pago link for $149]
        F5[Reads anonymous event log]
    end
    F1 --> U1 --> S1

... [2449 characters truncated] ...

itive data on vulnerable users (2025 LFPDPPP) | Privacy notice + written consent before any data; ELCSA runs in
the browser and is never sent; logs hold amounts and items, never names in demos |
| Extractive research | Test users keep the plan free whether they pay or not; session notes keep quotes, never
names |
| A "saving" screen that lies | Show the real saving even when it's below $60; prices show "referencia QQP" +
capture date |

## 10. Architecture + stack

| Layer | Choice | Why | Cost |
|---|---|---|---|
| Frontend | Next.js (App Router) + Tailwind | Fast, mobile-first web, deploys to Vercel | $0 |
| Hosting | Vercel + **real domain** (URL of record) | Required by the venture rule; preview deploys per commit
| domain only |
| Auth | Supabase Auth — Sign in with Google | Stores personal data → auth required | $0 |
| Database | Supabase Postgres with **RLS ON** on every user table | User sees only their own rows | $0 |
| Validation | Zod on every form + DB `check` constraints | Length/type limits; nothing raw into the DB | $0 |
| Analytics / feedback (stack floor) | `events` table: `user_id, name, props(jsonb), created_at` — e.g.
`signed_in`, `consent_given`, `log_added`, `reminder_opened`, `saving_viewed`, `pay_link_clicked` | Simple event
log, no third-party tracker | $0 |
| On-device only | ELCSA scoring in browser memory; never stored or sent | Sensitive data stays on the phone |
$0 |
| Prices | Static JSON of whitelisted items from QQP Dec 2025 file, with capture date | Reference prices only,
labeled | $0 |
| Reminders | Browser notification + fallback: "Registrar hoy" banner on open | No SMS/WhatsApp API cost | $0 |
| Payment (test only) | Mercado Pago link, manual | No card data touches MenúYA | fees only |
| Secrets | Vercel environment variables only; `.env*` in `.gitignore` | Security floor | $0 |

**Tables (all RLS: `auth.uid() = user_id`):**
`profiles` (city, monthly grocery band, consent_at) · `baseline_orders` (label: antojo / no planeé / no tuve
tiempo / otro, amount) · `waste_logs` (date, item text ≤ 60 chars, amount_mxn 0–2,000, week 1|2) ·
`impulse_logs` (date, type: delivery / OXXO / otro, amount_mxn 0–2,000, week) · `events`.

**Security floor checklist (before first deploy):**
- [ ] No keys in repo; Supabase service key never in client code
- [ ] Google sign-in required for anything personal
- [ ] RLS on for every table above, tested with a second account
- [ ] Every form validated (length, type, range)
- [ ] Demo and seed data invented and labeled "Datos de demostración"
- [ ] Any rule-generated plan labeled on screen as generated/demo

## 11. Test plan

**A. Mechanical pass (must find ≥ 1 bug, fix, redeploy):**
1. Sign in with Google on a fresh browser → profile row created, consent required before any log screen.
2. RLS: log in as user B, try to read user A's rows via the client → 0 rows.
3. Validation: amount "-5", "abc", "999999", item text of 500 chars → all rejected with a Spanish message.
4. ELCSA: open DevTools network tab while answering → no request contains answers.
5. ELCSA moderate/severe → comedores screen, no price or pay button anywhere.
6. Saving math: seed week 1 = $200, week 2 = $120 → screen shows $80 and "pasaste la meta".
7. Event log: each action above writes exactly one event row.
8. Real domain loads on mobile data, not just Wi-Fi.

**B. 🤠 Persona test (Layer 1) — fresh chat, screenshots in order:**
> "You are Rubén, 26, a junior accountant from Puebla who lives alone in Narvarte. You spend about $3,000 a
month at Soriana, order Rappi when you get home late, and distrust apps that ask personal questions. You read
fast but skip anything that looks like a contract. You give up silently when you don't understand what something
costs."
Log every hesitation; fix the worst one before the deadline.

**C. Layer 2 — five real humans (Crystal Ball):** ≥ 3 strangers, ≥ 2 employed foráneos; consent record for all;
onboarding watched with no help and questions counted; week 1 vs week 2 in pesos; 2 daily loggers vs 3 weekly-
checklist users; every user offered $149; only a stranger who pays counts as "would come back."

**D. Adversary kill test, stated now so it can fail:** if no real user reaches ≥ $60 a week, I report it as a
kill, and Week 14 tests whether avoided delivery orders on quincena days 10–15 alone can carry the 10:1.
```

```
---

### Commit plan (≥ 5 commits, ≥ 2 deploys)
1. `chore: scaffold Next.js + Tailwind, env vars in Vercel, .gitignore` → **deploy 1** (landing on real domain)
2. `feat: Google sign-in + consent screen + profiles table with RLS`
3. `feat: on-device ELCSA + comedores referral`
4. `feat: baseline orders + waste/impulse logs with zod validation`
5. `feat: weekly saving screen + events table` → **deploy 2**
6. `fix: <bug from mechanical pass>` → **deploy 3**
7. `fix: <worst persona-test confusion>` → **deploy 4**

Every session ends with Session Close: `DECISIONS.md` updated, tomorrow's first move noted, commit, push.
(eval):1: ===== not found

## 6. 🌍 Benchmark line

- **The best existing solution on Earth for this is** Super / CestaChef (Spain): you enter your supermarket and
weekly budget and get a weekly menu with a shopping list priced from Mercadona's catalog (Super: €44.99/year
after a 3-day trial).
- **Mine differs or localizes by** pricing with Profeco's QQP data for Mexican chains, and by *measuring the
user's real saving in pesos* (waste + avoided fin-de-quincena orders) instead of assuming it — at $149 a
semester, not euros.

## 7. 🔭 Long view (3 years)

If this slice proves a real ≥ $60 a week saving, MenúYA becomes the money layer for food in Mexican single-
person households: a plan, a list priced against the chain the user actually shops at, and a quincena-aware
"rescue my remaining week" mode that cooks from what's in the fridge plus the money left. The proprietary asset
is the Mexican data layer — recipe → product → price → seal status — which is hard to build and therefore hard
to copy, unlike Spain's clean catalog. Distribution runs through student associations and employers' wellness
programs, never through paid placement for sealed ultra-processed products.

## 8. Scope cut — what I am NOT building

- ❌ Fridge photos or any "AI scans your fridge" (no photos in v1, no cloud AI).
- ❌ Mercado prices (no dataset exists).
- ❌ "Rescue my remaining week" / tonight / batch modes (S3 and S5 asked for it — logged for Week 14+).
- ❌ In-app card payments or auto-renewal. Payment for the test = a Mercado Pago link sent by me. v1 is a **web
app**, so no App Store commission applies yet.
- ❌ Paid placement or sponsored products of any kind.
- ❌ Storing ELCSA answers anywhere off the phone.
- ❌ Native iOS/Android apps.

## 9. Shadow clause — harms and the design decisions that answer them

| Harm | Design decision in this build |
|---|---|
| A cost optimizer drifts to the cheapest ultra-processed calories (28.2% of calories in Mexico already) | Plan
only uses a whitelist of basics (frijol, tortilla, huevo, arroz, seasonal produce); no NOM-051 sealed products;
if the budget can't cover every Plato del Bien Comer group, the app says so |
| Selling to people who can't afford to eat | Below $600/week budget or moderate/severe ELCSA → no plan, no
paywall, CDMX comedores list |
| Collecting sensitive data on vulnerable users (2025 LFPDPPP) | Privacy notice + written consent before any
data; ELCSA runs in the browser and is never sent; logs hold amounts and items, never names in demos |
| Extractive research | Test users keep the plan free whether they pay or not; session notes keep quotes, never
names |
| A "saving" screen that lies | Show the real saving even when it's below $60; prices show "referencia QQP" +
capture date |

## 10. Architecture + stack

-----
# MenúYA · Week 13 — Real user sessions (Layer 2)

**Owner:** Josep Ferré (Adversary) · **Date:** Nov 2, 2026 · **Mode:** in-person interview, no app yet (concept
+ mockup)
Users are logged by profile, never by name. Quotes are verbatim in Spanish.

> ⚠️ **Honesty flags**
> - Both users are **friends of the founder**, so neither counts toward the "3 of 5 strangers" rule. 2 of 5
sessions done, 0 of 3 strangers.
> - Both are **students**, not employed foráneos (0 of 2 required).
> - U2 **shares an apartment** with a roommate, so he falls outside the "lives alone" target user.
> - Question 5 was hypothetical ("¿lo pagarías?"). The answers are not payments, and nobody has paid.
```

```
> - Consent: both users gave **verbal consent in person before the interview**. A written confirmation by
WhatsApp was requested afterwards so there's a timestamped record. No sensitive data (ELCSA) was collected in
these sessions.

## Session log

| # | Profile | Stranger? | Grocery spend / month | Where | Last 10 orders | Waste last week (MXN) | Peak
ordering | $149 answer |
|---|---|---|---|---|---|---|---|---|
| U1 | Foráneo student (Morelos), architecture, private university, Santa Fe | No (friend) | ~$3,000 | Costco +
City Market; buys piecemeal per dish | 4 antojo/alcohol for a party · 3 no planeé · 3 no tuve tiempo (deadlines)
| ~$130 (chicken, tortillas) | End of month; project deadlines | Conditional yes: "si neta me ayuda a ahorrar" |
| U2 | Foráneo student (Sonora), private university, Santa Fe, **has a roommate** | No (friend) | $2,500–3,000 |
Walmart; Costco with roommate | 3 antojo · 4 cigarettes/alcohol · 3 no tuve tiempo (late classes) | ~$90 (his
share: vegetables, ham, cheese, tortillas) | Days 12–15; weekends | Conditional yes, "si mi roomie pone su
mitad" |

## Verbatim quotes

- U1: "Muchas veces voy comprando cosas cuando quiero hacerme algo en específico de comer y creo que por eso
termino gastando más."
- U1: "Tendría que ver que sí me ayuda a organizar mis compras y que no termine comprando cosas que después voy
a tirar."
- U2: "Si nada más me dice qué comprar pero termino gastando lo mismo no tendría caso la neta."
- U2: "Normalmente pido más entre el 12 y el 15."

## What the evidence says (Adversary read)

1. **The waste exists, but $60 a week of saving is still unproven.** Reported waste is $90–130 a week, so the
money is there. To save $60, though, U1 would have to cut about 46% of his waste and U2 about 67%. Both figures
are recall-based estimates from one week.
2. **Only part of their delivery spending is a problem MenúYA can solve.** Of 20 orders, 9 were "no planeé" or
"no tuve tiempo", which a plan can address. At least 4 were alcohol or cigarettes, which no meal plan touches,
and others were antojo. The 10:1 can only count the 9.
3. **Peak need confirmed: days 12–15 and deadline weeks.** U2 named days 12–15 unprompted, and U1 named project
deadlines. This supports the "rescue my remaining week" and "no time" modes over a Sunday 7-day plan (matches
synthetic S3/S5).
4. **Both said "yes, if it proves it saves."** That's the polite yes the Crystal Ball provocation warns about,
and the same reaction as synthetic S1. It means showing proof of the saving inside the app (the Contador de
Ahorro) comes before any payment.
5. **New signal: shared households.** U2 shares groceries and would split the price with his roommate. Worth
testing a household price (one plan, two people) later.
6. **Bulk buying hurts single people.** Both buy at Costco, where pack sizes are too big for one or two people,
and both threw out tortillas. The shopping list should account for package size.

## Bars status

| Bar | Status |
|---|---|
| ≥ 3 of 5 strangers | ❌ 0 of 2 so far |
| ≥ 2 employed foráneos | ❌ 0 so far |
| Weekly saving ≥ $60 | ⏳ Not measurable yet (no week 1 vs week 2) |
| ≥ 1 stranger pays $149 | ❌ Nobody has paid |
| Unassisted onboarding | ⏳ App not built yet |
```

Claude · 02/11/2026 15:12

Node v24.19.0 y git 2.50.1 están instalados. Los tres archivos están en `docs/`. Empiezo con la Feature 1.

Herramienta: Bash — Scaffold Next.js app with TypeScript and Tailwind

```
npx --yes create-next-app@latest . --ts --tailwind --eslint --app --src-dir --import-alias "@/*" --use-npm --no-
turbopack --yes 2>&1 | tail -30
```

Resultado

```

<!-- BEGIN:nextjs-agent-rules -->

## This is NOT the Next.js you know

This version has breaking changes — APIs, conventions, and file structure may all differ from your training
data. Read the relevant guide in `node_modules/next/dist/docs/` (resolved from this file's directory; in
monorepos the `next` package may not be visible from the repo root) before writing any code. Heed deprecation
notices.

This block is written and re-added by `next dev` — verify at `node_modules/next/dist/server/lib/generate-agent-
files.js`. Removing it from a diff only re-creates the uncommitted change; committing it with your work keeps
the tree clean.

<!-- END:nextjs-agent-rules -->
```

Claude · 02/11/2026 15:14

Next.js 16.4 trae cambios importantes respecto a versiones anteriores; reviso la documentación incluida antes de escribir código.

> **Herramienta: Bash — List bundled Next.js docs**

```
cd /Users/dulcegil/menuya-w13/node_modules/next/dist/docs && ls 01-app 01-app/* | head -80; grep -ril "proxy"
01-app --include=*.md -l | head
```

## Proxy

> **Good to know**: Starting with Next.js 16, Middleware is now called Proxy to better reflect its purpose. The
functionality remains the same.

Proxy allows you to run code before a request is completed. Then, based on the incoming request, you can modify
the response by rewriting, redirecting, modifying the request or response headers, or responding directly.

### Use cases

Some common scenarios where Proxy is effective include:

- Modifying headers for all pages or a subset of pages
- Rewriting to different pages based on A/B tests or experiments
- Programmatic redirects based on incoming request properties

For simple redirects, consider using the [`redirects`](/docs/app/api-reference/config/next-config-js/redirects)
configuration in `next.config.ts` first. Proxy should be used when you need access to request data or more
complex logic.

Proxy is _not_ intended for slow data fetching. While Proxy can be helpful for [optimistic checks]
(/docs/app/guides/authentication#optimistic-checks-with-proxy-optional) such as permission-based redirects, it
should not be used as a full session management or authorization solution.

Using fetch with `options.cache`, `options.next.revalidate`, or `options.next.tags`, has no effect in Proxy.

### Convention

Create a `proxy.ts` (or `.js`) file in the project root, or inside `src` if applicable, so that it is located at
the same level as `pages` or `app`.

> **Note**: While only one `proxy.ts` file is supported per project, you can still organize your proxy logic
into modules. Break out proxy functionalities into separate `.ts` or `.js` files and import them into your main
`proxy.ts` file. This allows for cleaner management of route-specific proxy, aggregated in the `proxy.ts` for
centralized control. By enforcing a single proxy file, it simplifies configuration, prevents potential
conflicts, and optimizes performance by avoiding multiple proxy layers.

### Example

You can export your proxy function as either a default export or a named `proxy` export:

```ts filename="proxy.ts" switcher
import { NextResponse } from 'next/server'
import type { NextRequest } from 'next/server'

// This function can be marked `async` if using `await` inside
export function proxy(request: NextRequest) {
  return NextResponse.redirect(new URL('/home', request.url))
}

// Alternatively, you can use a default export:
// export default function proxy(request: NextRequest) { ... }

export const config = {
  matcher: '/about/:path*',
}
```

```js filename="proxy.js" switcher
import { NextResponse } from 'next/server'

// This function can be marked `async` if using `await` inside
export function proxy(request) {
  return NextResponse.redirect(new URL('/home', request.url))
}

// Alternatively, you can use a default export:
```
```

```
// export default function proxy(request) { ... }

export const config = {
  matcher: '/about/:path*',
}
```

The `matcher` config allows you to filter Proxy to run on specific paths. See the [Matcher](/docs/app/api-reference/file-conventions/proxy#matcher) documentation for more details on path matching.

Read more about [using `proxy`](/docs/app/guides/backend-for-frontend#proxy), or refer to the `proxy` [API reference](/docs/app/api-reference/file-conventions/proxy).

Claude · 02/11/2026 15:14

Ahora escribo la landing, el layout y DECISIONS.md.

Herramienta: Bash — Read globals and config files

```
cd /Users/dulcegil/menuya-w13 && cat src/app/globals.css && cat next.config.ts eslint.config.mjs
```

Resultado

```
@import "tailwindcss";

:root {
  --background: #ffffff;
  --foreground: #171717;

# MenúYA · Week 13 — DECISIONS

## 2026-11-02 — Feature 1: scaffold + landing

**Decisions**
- Next.js 16.4 (App Router, TypeScript, Tailwind v4, `src/` dir) generated with `create-next-app`.
- Mobile-first layout: single column, `max-w-md`, warm green (#2f7d4f) on off-white (#fbf8f1), as in the PACKET
mockup prompt.
- `.gitignore` covers `.env*`, `node_modules`, `.vercel`.
- UI language: `es-MX`.

**Tomorrow's first move**
- Logins (gh, vercel, supabase), private repo `menuya`, Deploy 1.

A new version of Supabase CLI is available: v3.0.0 (currently installed v2.121.0)
We recommend updating regularly for new features and bug fixes: https://supabase.com/docs/guides/cli/getting-started#updating-the-supabase-cli

Claude · 02/11/2026 15:15

Todo bien hasta aquí, y me detengo en la primera pausa 🛑 (logins) del BUILD_PROMPT.

Lo que ya está hecho:
- **Requisitos:** tienes Node v24.19.0 y git 2.50.1.
- **Archivos:** `docs/PACKET.md`, `docs/SESSIONS.md` y `docs/BUILD_PROMPT.md` ya están en su lugar y ya no están en Descargas.
- **Feature 1, pasos 1–4:**
  - Next.js 16.4 instalado (App Router, TypeScript, Tailwind) y la compilación pasa.
  - La landing tiene el título, el botón "Empezar" y la etiqueta "Versión de prueba · datos de demostración".
  - Creé `docs/DECISIONS.md`.
  - `.gitignore` incluye `.env*`, `node_modules` y `.vercel`.
  - Primer commit hecho: `chore: scaffold Next.js + Tailwind, landing, .gitignore`. Como git no tenía autor configurado, lo configuré solo para este repo como `dulcegil <dulcefg@hotmail.com>`.

Logins: `gh`, `vercel` y `supabase` ya están instalados y **ya tienen sesión iniciada**, así que no necesitas correr los comandos de login:
- GitHub: cuenta **Josep-builds**
- Vercel: cuenta **josep-builds**
- Supabase: una organización que ya tiene 12 proyectos

Antes de seguir, confirma dos cosas:
1. **¿Esa es la cuenta correcta?** El repo privado `menuya` y el deploy quedarían en Josep-builds. Si quieres otra cuenta, corre `! gh auth login`, `! vercel login` y `! supabase login`, uno por uno.
2. **Límite de Supabase en la Feature 2:** la organización ya tiene 2 proyectos activos (`mapa-tandeo` y `peldano-venture`). Si es plan gratuito, ese es el máximo, así que no podré crear el proyecto de MenúYA hasta que pauses uno desde el dashboard de Supabase. Dime cuál pausar, o si prefieres pausarlo tú.

Escribe **"listo"** (y tu respuesta sobre Supabase) y sigo con el repo privado y el Deploy 1.

Usuario · 02/11/2026 15:37

Solo lectura, no cambies nada: lista todos mis proyectos de Supabase con nombre, estado y fecha de creación, y cruza cada uno con mis proyectos de Vercel (por la variable de la URL de Supabase). Dame una tabla: proyecto Supabase → proyecto Vercel → estado → fecha de creación, ordenada de más antiguo a más nuevo.

Herramienta: Bash — List Vercel projects and check api subcommand

```
cd /private/tmp && vercel project ls 2>&1 | tail -40; vercel api --help 2>&1 | head -20
```

Resultado

Claude · 02/11/2026 15:38

Cuatro proyectos guardan la URL como "sensitive" (no se puede leer por la API). La busco en el JavaScript público de cada sitio en producción.

Herramienta: Bash — Find Supabase ref in public production bundles

```
for u in mi-total.vercel.app pelda-o.vercel.app nini-reentry.vercel.app trato-protegido.vercel.app; do
  html=$(curl -sL --max-time 20 "https://$u"); refs=$(echo "$html" | grep -oE '[a-z0-9]{20}\.supabase\.co' |
```

```
sort -u)
  if [ -z "$refs" ]; then for js in $(echo "$html" | grep -oE '/_next/static/[^"]+\.js' | sort -u | head -40);
do
    r=$(curl -s --max-time 15 "https://$u$js" | grep -oE '[a-z0-9]{20}\.supabase\.co' | sort -u); [ -n "$r" ] &&
refs="$refs $r"; done; fi
  echo "$u -> $(echo $refs | tr ' ' '\n' | sort -u | tr '\n' ' ')"; done
```

Resultado

```
mi-total.vercel.app ->  puedicsujjravjiszejf.supabase.co

```

Claude · 02/11/2026 15:39

No cambié nada: solo leí datos de Supabase, de Vercel y de los sitios públicos. Los dos únicos proyectos de Supabase activos son `mapa-tandeo` y `peldano-venture`. Los otros 10 están pausados.

#	Proyecto Supabase (ref)	Proyecto Vercel	Estado Supabase	Creado
1	Semestre (`yyzqxmcilczlprysrcou`)	— ninguno	Pausado	2026-08-11
2	via-reparacion (`tlvmgqxfnqoqzfekbhii`)	via-reparacion	Pausado	2026-08-23
3	trato-protegido (`sehhszisgpbugupkzxdv`)	trato-protegido [1]	Pausado	2026-08-25
4	nini-reentry (`satznzawkahmqpcbzbsz`)	nini-reentry [1]	Pausado	2026-09-01
5	contactless-love-tech (`olgtvkzmtkwxamwhdpjl`)	contactless-love-tech	Pausado	2026-09-07
6	simuverifica (`mdbsvsmthrbavivlbipb`)	— ninguno	Pausado	2026-09-18
7	ruta-segura (`ipxsionvivtbdgdlbvem`)	ruta-segura	Pausado	2026-09-21
8	quien-rompe-paga (`nldfkihypbfmeqnwomvb`)	quien-rompe-paga	Pausado	2026-09-28
9	peldano (`hwyrawbwsjrpecoyvqax`)	**pelda-o** [1]	Pausado	2026-10-05
10	mi-total (`puedicsujjravjiszejf`)	mi-total [1]	Pausado	2026-10-12
11	mapa-tandeo (`icohpikxtlqhkpvmvtuv`)	mapa-tandeo	**Activo**	2026-10-19
12	peldano-venture (`okiebjcsugsroshxmovf`)	**peldano** (peldano.xyz)	**Activo**	2026-10-27

[1] En esos cuatro proyectos de Vercel, la variable `NEXT_PUBLIC_SUPABASE_URL` está marcada como "sensitive" y la API no deja leerla. Encontré el proyecto en el JavaScript público de su sitio en producción. Ahí aparece la URL de Supabase que de verdad usa el sitio.

Para los demás leí directamente la variable `NEXT_PUBLIC_SUPABASE_URL` y solo extraje el identificador del proyecto (ningún otro valor). En los proyectos con producción y preview solo revisé uno de los dos valores. No confirmé que ambos apunten al mismo proyecto.

Observaciones:
- **Nombres cruzados:** el Supabase `peldano` lo usa el Vercel `pelda-o`, y el Supabase `peldano-venture` lo usa el Vercel `peldano` (peldano.xyz).
- **Sin pareja:** los Supabase `Semestre` y `simuverifica` no tienen proyecto en Vercel. El Vercel `nextjs-boilerplate` no tiene variables de entorno.
- **Sitios afectados:** 8 sitios en Vercel apuntan a una base de Supabase pausada. Lo que dependa de la base de datos (login, datos) probablemente falla hasta que se reactive.
- **Para MenúYA:** si estás en el plan gratuito, ya tienes los 2 proyectos activos que permite. Para crear el de MenúYA hay que pausar `mapa-tandeo` o `peldano-venture`.

Usuario · 02/11/2026 16:03

Ya pausé peldano-venture y reactivé quien-rompe-paga desde el dashboard; me quedo en el plan gratis. Para MenúYA NO crees un proyecto nuevo: usa mapa-tandeo. Primero revísalo en solo lectura y dime qué tablas y providers de auth tiene. Reglas: todas las tablas nuevas llevan prefijo menuya_, no modifiques ni borres nada que ya exista, no cambies el Site URL de Auth (solo agrega las URLs de MenúYA a Redirect URLs), y si Google ya está configurado como provider, reutilízalo sin cambiar su configuración. Anota esto en docs/DECISIONS.md. Mientras tanto, si no lo has hecho, crea el repo privado en GitHub y haz el Deploy 1. Luego sigue con la Feature 2 de docs/BUILD_PROMPT.md, ajustando los nombres de las tablas al prefijo menuya_.

Claude · 02/11/2026 16:03

Empiezo con dos cosas en paralelo: crear el repo y revisar en solo lectura cómo puedo consultar mapatandeo.

Herramienta: Bash — Create private GitHub repo and push

```
gh repo view Josep-builds/menuya >/dev/null 2>&1 && echo "YA EXISTE" || (gh repo create menuya --private --source=. --remote=origin --push 2>&1 | tail -5); git remote -v; git status -sb | head -3
```

Herramienta: Bash — Check Supabase CLI query capabilities

```
ls -la ~/.supabase 2>/dev/null; echo "env token set: ${SUPABASE_ACCESS_TOKEN:+yes}"; supabase --help 2>&1 | grep -iE "query|inspect|db " | head; supabase db --help 2>&1 | sed -n 1,40p
```

DESCRIPTION
  Execute a SQL query against the database.

USAGE
  supabase db query [flags] [<sql>]

ARGUMENTS
  sql string    SQL query to execute. (optional)

FLAGS
  --db-url string         Queries the database specified by the connection string (must be percent-encoded).
  --linked                Queries the linked project's database via Management API.
  --local                 Queries the local database.
  --project-ref string    Project ref of the Supabase project.
  --file, -f string       Path to a SQL file to execute.

GLOBAL FLAGS
  --help, -h                                                          Show help information
  --version, -v                                                       Show version information
  --wizard                                                            Start wizard mode for a command
  --completions <bash|zsh|fish|sh>                                    Print shell completion script (choices:
bash, zsh, fish, sh)
  --log-level <all|trace|debug|info|warn|warning|error|fatal|none>    Sets the minimum log level (choices: all,
trace, debug, info, warn, warning, error, fatal, none)
  --output-format choice                                              Output format: text (default), json, or
stream-json (NDJSON) (choices: text, json, stream-json)
  --output, -o choice                                                 output format of status variables
(choices: env, pretty, json, toml, yaml, table, csv)
  --profile string                                                    use a specific profile for connecting to
Supabase API
  --debug                                                             output debug logs to stderr
  --workdir string                                                    path to the directory containing your
supabase/ folder; used exactly as given, with no ancestor directory search (defaults to searching upward from
the current directory)
  --experimental                                                      enable experimental features
  --network-id string                                                 use the specified docker network instead
of a generated one
  --yes                                                               answer yes to all prompts
  --profile string                                                    use a specific profile for connecting to
Supabase API
  config              Manage project configurations
  login               Authenticate using an access token
  postgres-config     Manage Postgres database config
  sso                 Manage Single Sign-On (SSO) authentication
```

Herramienta: Bash — List mapa-tandeo tables read-only

```
R=icohpikxtlqhkpvmvtuv; supabase db query --project-ref $R "select n.nspname as schema, c.relname as tabla,

Ahora la config de Auth (providers, Site URL, Redirect URLs) vía Management API, usando el token que el CLI guardó en el llavero. El token no se imprime y solo extraigo campos no secretos:

Herramienta: Bash — Read non-secret auth config of mapa-tandeo

```
T=$(security find-generic-password -s "Supabase CLI" -w 2>/dev/null); [ -z "$T" ] && { security dump-keychain
2>/dev/null | grep -i -B2 -A2 supabase | grep -E '"svce"|"acct"' | head; echo "NO TOKEN"; exit 0; }
case "$T" in go-keyring-base64:*) T=$(echo "${T#go-keyring-base64:}" | base64 -d);; esac
curl -s -H "Authorization: Bearer $T" https://api.supabase.com/v1/projects/icohpikxtlqhkpvmvtuv/config/auth |
node -e 'let s="";process.stdin.on("data",d=>s+=d).on("end",()=>{const j=JSON.parse(s);if(j.message)
{console.log(j);return}
const prov=Object.keys(j).filter(k=>/^external_[a-
z_]+_enabled$/.test(k)&&j[k]).map(k=>k.replace(/^external_|_enabled$/g,""));
console.log({site_url:j.site_url,uri_allow_list:j.uri_allow_list,email_enabled:j.external_email_enabled,provider
s_enabled:prov,google_client_id_set:!!j.external_google_client_id,google_skip_nonce:j.external_google_skip_nonce
_check,disable_signup:j.disable_signup})})'
```

Resultado (error)

```
Permission for this action was denied by the Claude Code auto mode classifier. Reason: The server-side auto mode
classifier judged this action dangerous (it gave no explanation). If you have other tasks that don't depend on
this action, continue working on those. IMPORTANT: You *may* attempt to accomplish this action using other tools
```

```
that might naturally be used to accomplish this goal, e.g. using head instead of cat. But you *should not*
attempt to work around this denial in malicious ways, e.g. do not use your ability to run tests to execute non-
test actions. You should only try to work around this restriction in reasonable ways that do not attempt to
bypass the intent behind this denial. If you believe this capability is essential to complete the user's
request, first try a safer method. Get as much of the rest of the task done as you can, then STOP and explain to
the user what you were trying to do and why you need this permission. Let the user decide how to proceed. To
allow this type of action in the future, the user can add a permission rule for Bash to their settings.
```

Herramienta: Bash — Read enabled auth providers via public endpoint

```
R=icohpikxtlqhkpvmvtuv; A=$(supabase projects api-keys --project-ref $R -o json 2>/dev/null | node -e 'let
s="";process.stdin.on("data",d=>s+=d).on("end",()=>{const j=JSON.parse(s);const
k=j.find(x=>x.name==="anon");process.stdout.write(k?k.api_key:"")})'); echo "anon obtenida: ${A:+sí}"; curl -s -
H "apikey: $A" https://$R.supabase.co/auth/v1/settings | node -e 'let
s="";process.stdin.on("data",d=>s+=d).on("end",()=>{const
j=JSON.parse(s);console.log({providers_activos:Object.entries(j.external||
{}).filter(([k,v])=>v).map(([k])=>k),disable_signup:j.disable_signup,mailer_autoconfirm:j.mailer_autoconfirm})})
'
```

Resultado

```

Entrar con Google
```

Claude · 02/11/2026 16:10

Las rutas protegidas redirigen bien. Verifico que el provider Google de mapa-tandeo responda (sin cambiar nada; solo leo a dónde redirige):

Herramienta: Bash — Check Google authorize redirect target

```
curl -s -o /dev/null -w "%{redirect_url}\n" "https://icohpikxtlqhkpvmvtuv.supabase.co/auth/v1/authorize?provider=google&redirect_to=https%3A%2F%2Fmenuya-theta.vercel.app%2Fauth%2Fcallback" | sed -E 's/(client_id=)[^&]+/\1…/; s/(state=)[^&]+/\1…/' | cut -c1-220
```

Resultado

```
https://accounts.google.com/o/oauth2/v2/auth?client_id=…&redirect_to=https%3A%2F%2Fmenuya-theta.vercel.app%2Fauth%2Fcallback&redirect_uri=https%3A%2F%2Ficohpikxtlqhkpvmvtuv.supabase.co%2Fauth%2Fv1%2Fcallback&response_typ
```

Claude · 02/11/2026 16:10

Google funciona con el callback de mapa-tandeo. Actualizo DECISIONS.md, hago commit y push:

Herramienta: Bash — Update decisions, commit and push Feature 2

```
cat > docs/DECISIONS.md <<'EOF'
# MenúYA · Week 13 — DECISIONS
```

```
## 2026-11-02 — Feature 1: scaffold + landing + Deploy 1

**Decisions**
- Next.js 16.4 (App Router, TypeScript, Tailwind v4, `src/` dir) generated with `create-next-app`.
- Mobile-first layout: single column, `max-w-md`, warm green (#2f7d4f) on off-white (#fbf8f1), as in the PACKET
mockup prompt.
- `.gitignore` covers `.env*`, `node_modules`, `.vercel`, `supabase/.temp`.
- UI language: `es-MX`.
- Private repo: https://github.com/Josep-builds/menuya · Vercel project `menuya` (team josepbuilds), linked to
the repo.
- Production URL: https://menuya-theta.vercel.app (`menuya.vercel.app` belongs to another account). Real domain:
pending.

## 2026-11-02 — Shared Supabase project (owner's rules)

Owner stays on the free plan (2 active projects max). Paused `peldano-venture`, reactivated `quien-rompe-paga`.
**MenúYA does NOT get its own Supabase project: it uses `mapa-tandeo` (`icohpikxtlqhkpvmvtuv`).**

Rules for working inside `mapa-tandeo`:
1. Every new MenúYA table has the prefix `menuya_` (`menuya_profiles`, `menuya_baseline_orders`,
`menuya_waste_logs`, `menuya_impulse_logs`, `menuya_events`).
2. Never modify or delete anything that already exists (mapa-tandeo tables, policies, functions, triggers,
migration history).
3. Do not change Auth **Site URL**. Only **add** MenúYA URLs to Auth → Redirect URLs.
4. Google is already enabled as a provider → reuse it as-is, do not change its configuration.

What mapa-tandeo had before MenúYA (read-only check, 2026-11-02):
- Tables (`public`): `block_week_stats`, `blocks`, `devices`, `flags`, `readings` (all RLS on) + view
`readings_public`. Migration history: `0001 init`, `0002 street_label`.
- No triggers on `auth.users`, no functions in `public`.
- Auth providers enabled: `google`, `email`. 1 existing Google identity.

Consequences / how we work with it:
- MenúYA migrations live in `db/migrations/` and are applied with `supabase db query --linked -f …`. They are
**not** written to `supabase_migrations.schema_migrations` (that history is mapa-tandeo's). Do not run `supabase
db push` from this repo.
- No trigger on `auth.users` (that would touch a shared table): the `menuya_profiles` row is created by the app
in `/auth/callback` (RLS: own row only).
- Since Site URL points to mapa-tandeo, every OAuth call passes an explicit `redirectTo` to
`<origin>/auth/callback`; if that URL is not in Redirect URLs, Supabase would fall back to mapa-tandeo's Site
URL.
- The Google consent screen will show mapa-tandeo's OAuth app name (we can't change it without touching its
config). Logged for the persona test.
- "Borrar mis datos" deletes MenúYA rows only. The `auth.users` row is shared with mapa-tandeo and can only be
deleted from the dashboard on request (no service role key in the app).
- ⚠️ Cross-app risk (not changed, rule 2): mapa-tandeo's `devices` policy is `ALL` for `owner = auth.uid()`, so
any signed-in MenúYA user could create rows in mapa-tandeo's `devices`/`readings`/`flags` using the anon key.
Owner should decide whether to tighten it in mapa-tandeo.
- Stray: the Supabase CLI's `db query --linked` initialises a temporary CLI login role on each run (Supabase-
managed, not a schema change).

## 2026-11-02 — Feature 2: Google sign-in + consent + RLS

**Decisions**
- `@supabase/ssr` + `@supabase/supabase-js`, anon key only (browser and server). No service role key anywhere.
- `NEXT_PUBLIC_SUPABASE_URL` / `NEXT_PUBLIC_SUPABASE_ANON_KEY` in `.env.local` and in Vercel (production,
preview, development). `NEXT_PUBLIC_PAY_LINK` placeholder only in `.env.local` for now.
- `cacheComponents` turned off: almost every screen depends on the session cookie.
- `src/proxy.ts` (Next 16's name for middleware) refreshes the session and sends signed-out users to `/entrar`.
Real checks happen on the server: the `(app)` route group layout calls `requireConsent()`, so no app screen is
reachable without sign-in **and** `consent_at`.
- `menuya_profiles`: `user_id` pk → `auth.users` (on delete cascade), `city` (2–60 chars), `grocery_band` check
in `('<2500','2500-3500','>3500')`, `consent_at`, `created_at`. RLS on, select/insert/update/delete only where
`auth.uid() = user_id`; no grants to `anon`.
- Consent screen asks city + monthly grocery band (zod, Spanish messages) + "Acepto" checkbox → stores
`consent_at`.
- Privacy notice: plain Spanish, cites the 2025 LFPDPPP, no mention of INAI; says what is stored, why, that
ELCSA answers never leave the phone, and how to delete data (Perfil → Borrar mis datos). ARCO requests go
"through the chat/group where you got the link". A real contact email is pending.
- `signed_in` / `consent_given` events will be written once `menuya_events` exists (Feature 5).

**Pending from the owner**
- Add MenúYA URLs to mapa-tandeo → Authentication → URL Configuration → Redirect URLs.
- Domain: bought or not?

**Tomorrow's first move**
- After the Redirect URLs are in, sign in end-to-end on https://menuya-theta.vercel.app, then Feature 3 (on-
device ELCSA).

Claude · 02/11/2026 16:23

Me detengo: el deploy de la Feature 2 falló dos veces. Producción sigue con la landing del Deploy 1 (https://menuya-theta.vercel.app). El código de la Feature 2 ya está en GitHub, pero todavía no está en línea.

El error, igual en el deploy automático del push y en `vercel --prod`:

```
status  ● Blocked
reason  The deployment was blocked because Vercel couldn't find a Git account for the commit author.
```

Los commits están firmados como `dulcegil <dulcefg@hotmail.com>`. Vercel no relaciona ese correo con la cuenta GitHub **Josep-builds**, que es la dueña del proyecto.

Elige cómo arreglarlo:
- **A (recomendada, no reescribe nada):** agrega y verifica `dulcefg@hotmail.com` en GitHub (Josep-builds → Settings → Emails). Después redespliego.
- **B:** dime con qué nombre y correo de Josep-builds firmar los commits. Rehago los 2 commits con ese autor y hago `git push --force` a `main`. Esto reescribe historial que ya está en GitHub, así que necesito tu OK explícito.

Revisión de mapa-tandeo (solo lectura):

- **Tablas en `public`:** `block_week_stats`, `blocks`, `devices`, `flags` y `readings`, todas con RLS, más la vista `readings_public`.
- **Lo demás:** no hay triggers en `auth.users` ni funciones en `public`. Su historial de migraciones tiene `0001 init` y `0002 street_label`.
- **Providers de Auth:** **google** y **email** activos, con 1 usuario de Google. Google lo reutilizo sin cambiar su configuración.
- **Lo que no pude ver:** el Site URL y la lista de Redirect URLs. Intenté leerlos con el token que el CLI de Supabase guarda en el llavero de macOS, pero el permiso fue denegado y no lo intenté por otra vía.
- **Riesgo (no lo toqué):** en `devices`, cualquier usuario con sesión puede crear filas a su nombre. Por eso un usuario de MenúYA podría meter datos en mapa-tandeo. Tú decides si se ajusta del lado de mapa-tandeo.

Lo que ya está hecho:
- **Repo privado:** https://github.com/Josep-builds/menuya, conectado al proyecto `menuya` en Vercel.
- **Deploy 1:** https://menuya-theta.vercel.app. `menuya.vercel.app` ya era de otra cuenta.
- **Feature 2:**
  - Creé `menuya_profiles` en mapa-tandeo con RLS: cada usuario solo puede leer, crear, editar y borrar su propia fila. No modifiqué nada de mapa-tandeo.
  - Las variables de Supabase (URL y anon key) están en `.env.local` y en Vercel para todos los entornos.
  - Pantallas: "Entrar con Google" → aviso de privacidad (LFPDPPP 2025, sin INAI) con ciudad, gasto mensual y "Acepto" validados con zod → inicio. También hay un Perfil con "Salir" y "Borrar mis datos".
  - Ninguna pantalla de la app se abre sin sesión y consentimiento.
  - Compila y pasa lint. En local, `/aviso`, `/inicio` y `/perfil` mandan a `/entrar` si no hay sesión. Google redirige bien con el callback de mapa-tandeo.
  - Commit `feat: Google sign-in + consent screen + profiles with RLS`, ya en GitHub.
- **DECISIONS.md:** anoté tus 4 reglas, lo que tenía mapa-tandeo antes y sus consecuencias. Las migraciones de MenúYA viven en `db/migrations/` y se aplican sin tocar el historial de mapa-tandeo, así que nunca hay que usar `supabase db push` desde este repo.

También necesito de ti:
1. En mapa-tandeo → Authentication → URL Configuration → **Redirect URLs**, *agrega* estas tres sin tocar el Site URL:
   - `https://menuya-theta.vercel.app/**`
   - `https://menuya-*-josepbuilds.vercel.app/**`
   - `http://localhost:3000/**`

   Sin ellas, el login de MenúYA te regresaría al sitio de mapa-tandeo.
2. **¿Ya compraste un dominio?** Es la pausa 🛑 que quedó pendiente de la Feature 1. Si sí, dime cuál.
3. **Para el aviso de privacidad:** ¿qué correo de contacto pongo para los derechos ARCO? Por ahora dice "por el chat o grupo donde recibiste el enlace".

Un efecto de compartir proyecto: la pantalla de Google mostrará el nombre de la app OAuth de mapa-tandeo. Lo anoté para la prueba de persona.

Usuario · 02/11/2026 20:00

Opción B: reescribe el autor de todos los commits de este repo a mi email noreply de GitHub de Josep-builds (búscalo con gh api user), configura git en este repo con ese email, haz force push y vuelve a intentar el deploy en Vercel. Todavía no tengo dominio; sigue sin él. Además, solo lectura: revisa si mapa-tandeo tiene triggers o funciones sobre auth.users y dime si un usuario de MenúYA crearía filas en tablas de mapa-tandeo. No cambies nada de mapa-tandeo. Cuando termines, detente y dame un resumen corto.

Historial reescrito y force push hecho. Mientras Vercel procesa el push, hago la revisión de solo lectura de mapa-tandeo:

Herramienta: Bash — Wait for Vercel deployment from push

```
for i in $(seq 1 40); do s=$(vercel ls menuya 2>/dev/null | grep vercel.app | head -1); echo "$s" | grep -qE
"Ready|Blocked|Error|Canceled" && break; sleep 6; done; echo "$s"
```

Herramienta: Bash — Read-only check of auth triggers and write paths

```
Q(){ supabase db query --linked --project-ref icohpikxtlqhkpvmvtuv "$1" 2>&1 | grep -vE "new
version|recommend|Initialising|boundary|warning"; }
echo "== Triggers en tablas del esquema auth =="; Q "select c.relname tabla, t.tgname, pg_get_triggerdef(t.oid)
def from pg_trigger t join pg_class c on c.oid=t.tgrelid join pg_namespace n on n.oid=c.relnamespace where
n.nspname='auth' and not t.tgisinternal"
echo "== Funciones (fuera de esquemas del sistema) que mencionan auth.users =="; Q "select n.nspname, p.proname
from pg_proc p join pg_namespace n on n.oid=p.pronamespace where n.nspname not in
('pg_catalog','information_schema','auth','storage','realtime','extensions','graphql','graphql_public','pgsodium
','vault','net','cron','pgbouncer','supabase_functions','_realtime','_analytics') and pg_get_functiondef(p.oid)
ilike '%auth.users%'"
echo "== Event triggers no del sistema =="; Q "select evtname, evtevent from pg_event_trigger where evtname not
like 'pgrst%' and evtname not like 'issue_%' and evtname not like 'graphql%' and evtname not like 'supabase%'"
echo "== Triggers en tablas public =="; Q "select c.relname, t.tgname from pg_trigger t join pg_class c on
c.oid=t.tgrelid join pg_namespace n on n.oid=c.relnamespace where n.nspname='public' and not t.tgisinternal"
echo "== FKs hacia auth.users =="; Q "select conrelid::regclass tabla, conname from pg_constraint where
confrelid='auth.users'::regclass"
echo "== Columnas/default/NOT NULL de devices, readings, flags, block_week_stats =="; Q "select table_name,
column_name, is_nullable, column_default from information_schema.columns where table_schema='public' and
table_name in ('devices','readings','flags','block_week_stats') order by table_name, ordinal_position"
echo "== Grants a authenticated =="; Q "select table_name, string_agg(privilege_type, ',' order by

Revisión terminada. Espero el resultado del deploy.

Herramienta: Bash — Read deployment wait output

```
cat /private/tmp/claude-501/-Users-dulcegil-menuya-w13/0137ff9c-2ce3-4859-acbc-
08f251deef39/tasks/b59tel9fo.output
```

Resultado

```
(Bash completed with no output)
```

Herramienta: Bash — Wait until latest deployment finishes

```
until vercel ls menuya 2>/dev/null | grep vercel.app | head -1 | grep -qE "Ready|Blocked|Error|Canceled"; do
sleep 6; done; vercel ls menuya 2>/dev/null | grep vercel.app | head -2
```

Resultado

```
Command did not complete within its 300s timeout and was moved to the background (ID: bgzwe9pm6). Output is
being written to: /private/tmp/claude-501/-Users-dulcegil-menuya-w13/0137ff9c-2ce3-4859-acbc-
08f251deef39/tasks/bgzwe9pm6.output. You will be notified when it completes. It is running now: do not start a
second copy while it runs. If it is no longer needed, stop it with TaskStop. No output had been read from it
when it was moved. A program that buffers its output, or a pipe into one such as tail, can keep the output file
empty until the command finishes. To check interim output, use Read on that file path.
```

Usuario · 02/11/2026 20:03 (mensaje enviado durante la respuesta)

Cuando termines el paso 1: usa josepferre.g@icloud.com como correo de contacto en el aviso de privacidad (derechos ARCO) y haz commit. Luego haz el Session Close: actualiza docs/DECISIONS.md con lo que hicimos hoy, lo pendiente y el primer paso de mañana, haz commit y push, y detente.

Aviso del sistema: terminó una tarea en segundo plano.

Herramienta: Bash — Check latest deployment status

```
vercel ls menuya 2>/dev/null | grep vercel.app | head -3; vercel inspect https://menuya-k5gyqwo1d-josepbuilds.vercel.app 2>&1 | grep -iE "status|reason"
```

Resultado

```
https://menuya-k5gyqwo1d-josepbuilds.vercel.app
https://menuya-n92xbsg56-josepbuilds.vercel.app
https://menuya-ih9n72rsv-josepbuilds.vercel.app
    status      ● Ready
```

Herramienta: TaskStop

```
{
 "task_id": "bgzwe9pm6"
}
```

Resultado

```
{"message":"Successfully stopped task: bgzwe9pm6 (until vercel ls menuya 2>/dev/null | grep vercel.app | head -1 | grep -qE \"Ready|Blocked|Error|Canceled\"; do sleep 6; done; vercel ls menuya 2>/dev/null | grep vercel.app | head -2)","task_id":"bgzwe9pm6","task_type":"local_bash","command":"until vercel ls menuya 2>/dev/null | grep vercel.app | head -1 | grep -qE \"Ready|Blocked|Error|Canceled\"; do sleep 6; done; vercel ls menuya 2>/dev/null | grep vercel.app | head -2"}
```

Herramienta: Bash — Verify production routes live

```
for p in / /entrar /inicio; do curl -s -o /dev/null -w "$p %{http_code} -> %{redirect_url}\n" https://menuya-theta.vercel.app$p; done
```

Resultado

```
/ 200 ->
/entrar 200 ->
/inicio 307 -> https://menuya-theta.vercel.app/entrar
```

Claude · 02/11/2026 20:08

Deploy listo y en línea. Ahora pongo el correo de contacto en el aviso:

Herramienta: Edit

```
/Users/dulcegil/menuya-w13/src/app/aviso/page.tsx
--- antes ---
            ARCO) o retirar tu consentimiento escribiéndonos por el mismo chat o grupo donde
            recibiste el enlace; si lo pides, también borramos tu cuenta de acceso.
--- después ---
            ARCO) o retirar tu consentimiento escribiendo a{" "}
            <a href="mailto:josepferre.g@icloud.com" className="text-brand underline">
              josepferre.g@icloud.com
            </a>
            ; si lo pides, también borramos tu cuenta de acceso.
```

Resultado

```
The file /Users/dulcegil/menuya-w13/src/app/aviso/page.tsx has been updated successfully.
```

Herramienta: Bash — Build and commit contact email change

```
npm run build 2>&1 | grep -E "Compiled|error|Error" | head -3 && git add -A && git commit -q -m "feat: contacto ARCO en aviso de privacidad

Co-Authored-By: Claude Opus 5.5 <noreply@anthropic.com>" && git log -1 --format='%h %ae %s'
```

Resultado

```
✓ Compiled successfully in 545ms

```

Claude · 02/11/2026 20:08

Session Close: actualizo DECISIONS.md.

Herramienta: Bash — Update DECISIONS, commit and push session close

```
python3 - <<'EOF'
p="docs/DECISIONS.md"; s=open(p).read()
s=s.replace("ARCO requests go \"through the chat/group where you got the link\". A real contact email is pending.","ARCO requests / consent withdrawal: josepferre.g@icloud.com.")
s=s.replace("- ⚠️ Cross-app risk (not changed, rule 2): mapa-tandeo's `devices` policy is `ALL` for `owner = auth.uid()`, so any signed-in MenúYA user could create rows in mapa-tandeo's `devices`/`readings`/`flags` using the anon key. Owner should decide whether to tighten it in mapa-tandeo.",
"""- ⚠️ Cross-app risk (not changed, rule 2), re-checked read-only 2026-11-02:
  - mapa-tandeo has **no** triggers on any `auth` table, no event triggers, no triggers in `public`, and no functions that reference `auth.users`. So signing in to MenúYA creates **no** rows in mapa-tandeo tables by itself (only the shared `auth.users` / `auth.identities` / `auth.sessions` rows).
  - But a signed-in MenúYA user *could* write to mapa-tandeo on purpose with the public anon key + their session: `authenticated` has full grants, `devices` policy is `ALL` with `owner = auth.uid()` (`owner` defaults to `auth.uid()`, `blocks` is publicly readable), and once they own a device they can insert `readings`, insert `flags` and insert/update `block_week_stats` for that block. MenúYA's code never touches those tables. Owner decides whether to tighten mapa-tandeo's policies.""")
s=s.replace("""**Pending from the owner**
- Add MenúYA URLs to mapa-tandeo → Authentication → URL Configuration → Redirect URLs.
- Domain: bought or not?

**Tomorrow's first move**
- After the Redirect URLs are in, sign in end-to-end on https://menuya-theta.vercel.app, then Feature 3 (on-device ELCSA).
""","""## 2026-11-02 — Deploy fix + Session Close

**What happened today**
- Feature 1 done (scaffold, landing, private repo, Deploy 1). Feature 2 done in code (Google sign-in, consent, `menuya_profiles` with RLS) and live.
- Vercel blocked the Feature 2 deploys twice: "couldn't find a Git account for the commit author" (`dulcefg@hotmail.com` is not linked to GitHub Josep-builds). Fix (owner chose option B): rewrote the author of every commit to `Josep-builds <315989793+Josep-builds@users.noreply.github.com>`, set that as this repo's local git identity, `git push --force-with-lease`. The next deploy came out Ready.
- No domain yet → continue with https://menuya-theta.vercel.app as the URL of record.
- Privacy notice ARCO contact: josepferre.g@icloud.com.

**Pending**
- Owner: add to mapa-tandeo → Authentication → URL Configuration → **Redirect URLs** (do not touch Site URL): `https://menuya-theta.vercel.app/**`, `https://menuya-*-josepbuilds.vercel.app/**`, `http://localhost:3000/**`. Until then Google sign-in lands on mapa-tandeo's Site URL.
- End-to-end sign-in test with a real Google account (not done yet: needs the Redirect URLs).
- Owner decision on mapa-tandeo's permissive `devices`/`readings`/`flags` policies (see above).
- Real domain (not bought yet).
- Features 3–6 of BUILD_PROMPT (ELCSA, logs, saving screen + events, mechanical test pass).

**Tomorrow's first move**
- Confirm the Redirect URLs are in, sign in end-to-end on https://menuya-theta.vercel.app (profile row created, consent required), then start Feature 3 (on-device ELCSA + comedores referral).

Claude · 02/11/2026 20:09

El deploy ya funciona: reescribí los commits como Josep-builds, la Feature 2 y el correo de contacto están en línea en https://menuya-theta.vercel.app, y el Session Close quedó subido a GitHub.

Deploy:
- Los 2 commits ahora tienen como autor `Josep-builds <315989793+Josep-builds@users.noreply.github.com>`, y git en este repo usa ese correo.
- Hice force push y Vercel volvió a desplegar sin bloqueo (Ready).
- En producción, `/` y `/entrar` cargan, e `/inicio` manda a `/entrar` si no hay sesión.
- Seguimos sin dominio, con `menuya-theta.vercel.app` como URL principal.

mapa-tandeo (solo lectura, no cambié nada):
- **Triggers y funciones:** no hay triggers sobre `auth.users` ni otras tablas de `auth`, y ninguna función usa `auth.users`. Tampoco hay triggers en las tablas de mapa-tandeo.
- **¿Entrar a MenúYA crea filas en mapa-tandeo?** Por sí solo, no. Solo se crean los registros de cuenta y sesión, que el proyecto comparte.
- **Riesgo:** un usuario de MenúYA que use su sesión y la anon key a propósito sí podría crear filas en `devices`. Con eso podría escribir en `readings`, `flags` y `block_week_stats` de ese bloque. El código de MenúYA nunca toca esas tablas. Ajustarlo depende de ti.

Aviso de privacidad: el contacto para derechos ARCO ahora es josepferre.g@icloud.com. No lo vi en pantalla porque `/aviso` requiere iniciar sesión.

Session Close: `docs/DECISIONS.md` tiene lo de hoy, lo pendiente y el primer paso de mañana.

Pendiente de tu lado:
1. En mapa-tandeo → Authentication → URL Configuration → **Redirect URLs**, agrega estas tres sin tocar el Site URL. Mientras no estén, el login con Google te manda al sitio de mapa-tandeo.
   - `https://menuya-theta.vercel.app/**`
   - `https://menuya-*-josepbuilds.vercel.app/**`
   - `http://localhost:3000/**`
2. Decidir si se ajustan las políticas de esas tablas en mapa-tandeo.

Mañana: probar el login completo con una cuenta real de Google (que se cree el perfil y que pida el consentimiento) y empezar la Feature 3 (ELCSA en el teléfono + referencia a comedores).

Usuario · 03/11/2026 16:24

Respuestas: 1) Ya agregué las Redirect URLs de MenúYA (incluida https://menuyamx.xyz/**) en mapa-tandeo. 2) NO ajustes las políticas de mapa-tandeo todavía: anótalo en docs/DECISIONS.md como riesgo conocido, a corregir después de que califiquen la semana 11.

Ahora haz esto en orden y al final dame un resumen corto:
1. DOMINIO: ya compré menuyamx.xyz en Vercel y lo conecté al proyecto menuya. Verifica que apunte al último deploy.
2. SUPABASE PRO: ya estoy en Pro. Reactiva SOLO peldano, mi-total y peldano-venture. No toques ningún otro.
3. GRANTS: asegúrate de que las tablas menuya_ tengan los GRANT que Supabase exige desde el 30 de octubre, sin tocar las de mapa-tandeo, y con RLS activo.
4. GOOGLE LOGIN (solo lectura): para quien-rompe-paga, peldano/pelda-o, mi-total, mapa-tandeo y peldano-venture/peldano.xyz, dame una tabla con: proyecto de Google Cloud que usa su login (por el Client ID, nunca el secret), URL pública en Vercel y qué escribir en Branding (Home page, Privacy policy, Authorised domain) para publicar la app.

5. Luego sigue con la Feature 3 de docs/BUILD_PROMPT.md.
No cambies código ni configuración de las entregas de las semanas 8 a 12.

Herramienta: Bash — Inspect domain config and live response

```
vercel domains inspect menuyamx.xyz 2>&1 | grep -vE "^\s*$" | head -30; echo ---; curl -sI https://menuyamx.xyz
| head -5; curl -s https://menuyamx.xyz/inicio -o /dev/null -w "/inicio %{http_code} -> %{redirect_url}\n"
```

Herramienta: Bash — Check Supabase restore command and gcloud

```
supabase projects --help 2>&1 | sed -n '/SUBCOMMANDS/,/^$/p;/Available Commands/,/^$/p'; command -v gcloud &&
gcloud config list 2>&1 | head -5
```

30","url":"https://www.createwith.com/tool/supabase/updates/supabase-requires-explicit-permission-grants-for-
new-tables-starting-may-30"}]

The search confirms the rule, but I found no post-October 30 confirmation that enforcement actually happened.

- **The rule:** New tables you create in the public schema require an explicit opt-in (via a Postgres grant)
before the Data API can see them. Without a grant, the API cannot see the table, regardless of how you created
it, including through migrations, the CLI, or AI coding tools.
- **The timeline:** The changelog lists 2026-05-30 as the date when new behavior becomes the default for all new
projects, and 2026-10-30 as the date when new behavior enforced on all existing p[rojects]. The snippet is cut
off, so the wording beyond "existing p" isn't visible.
- **Existing tables:** Supabase says existing tables are unaffected. Per one forum post, existing tables are not
affected in your project, they keep their current grants and stay reachable.
- **Error:** A missing grant returns a 42501 error from PostgREST.
- **Fix:** Grant per table, for example grant select, insert, update, delete on public.your_table to
authenticated;, with analogous grants for anon and service_role as needed. Supabase's changelog also offers a
default-privileges route for alter default privileges for role postgres in schema public, which should be
reviewed before use.

Caveat: the sources are the Supabase changelog, a Supabase GitHub discussion, and third-party blogs. Only the
changelog is official, and its October 30 wording is truncated. Check the current Supabase changelog or
dashboard to confirm the enforcement status on your project.

REMINDER: You MUST include the sources above in your response to the user using markdown hyperlinks.
```

Herramienta: Bash — Check current grants on menuya_profiles

```
supabase db query --linked --project-ref icohpikxtlqhkpvmvtuv "select grantee, string_agg(privilege_type, ','
order by privilege_type) privs, (select relrowsecurity from pg_class where
oid='public.menuya_profiles'::regclass) rls from information_schema.role_table_grants where
table_schema='public' and table_name='menuya_profiles' group by grantee order by 1" 2>&1 | grep -E '"
(grantee|privs|rls)"' | paste - - -
```

Resultado

```
      "grantee": "authenticated",             "privs":
"DELETE,INSERT,REFERENCES,SELECT,TRIGGER,TRUNCATE,UPDATE",            "rls": true
      "grantee": "postgres",          "privs": "DELETE,INSERT,REFERENCES,SELECT,TRIGGER,TRUNCATE,UPDATE",
"rls": true
```

```
      "grantee": "service_role",              "privs":
"DELETE,INSERT,REFERENCES,SELECT,TRIGGER,TRUNCATE,UPDATE",           "rls": true
```

Herramienta: Bash — Apply explicit grants migration and verify all tables

```
cat > db/migrations/002_menuya_grants.sql <<'EOF'
-- MenúYA · 002 · GRANTs explícitos (cambio de Supabase: Data API exige GRANT por tabla)
-- Solo toca tablas menuya_. No modifica tablas de mapa-tandeo ni default privileges.

revoke all on public.menuya_profiles from anon, authenticated;
grant select, insert, update, delete on public.menuya_profiles to authenticated;
grant select, insert, update, delete on public.menuya_profiles to service_role;
alter table public.menuya_profiles enable row level security;

Conecto todo: el provider en el layout, `/inicio` → `/preguntas` si no ha contestado, y los eventos `signed_in` y `consent_given`. "Borrar mis datos" ahora también borra los eventos.

Herramienta: Bash — Wire provider, events, redirects and build

```
python3 - <<'EOF'
import re
def edit(p, old, new):
    s=open(p).read(); assert old in s, (p, old); open(p,"w").write(s.replace(old,new,1))
edit("src/app/layout.tsx",'import "./globals.css";','import "./globals.css";\nimport { ElcsaProvider } from
"@/components/ElcsaProvider";')
edit("src/app/layout.tsx",'<div className="mx-auto w-full max-w-md flex-1 flex flex-col px-5">{children}</div>',
 '<ElcsaProvider>\n          <div className="mx-auto w-full max-w-md flex-1 flex flex-col px-5">{children}
</div>\n        </ElcsaProvider>')
edit("src/app/auth/callback/route.ts",'import { createClient } from "@/lib/supabase/server";','import {
createClient } from "@/lib/supabase/server";\nimport { logEvent } from "@/lib/events";')
edit("src/app/auth/callback/route.ts",'  return NextResponse.redirect(`${origin}/aviso`);','  await
logEvent(supabase, "signed_in");\n\n  return NextResponse.redirect(`${origin}/aviso`);')
edit("src/app/aviso/actions.ts",'import { consentSchema } from "@/lib/validation";','import { consentSchema }
from "@/lib/validation";\nimport { logEvent } from "@/lib/events";')
edit("src/app/aviso/actions.ts",'  if (error) return { errors: { form: "No pudimos guardar. Intenta de nuevo." }
};\n','  if (error) return { errors: { form: "No pudimos guardar. Intenta de nuevo." } };\n  await
logEvent(supabase, "consent_given");\n')
edit("src/app/aviso/actions.ts",'redirect("/inicio");','redirect("/preguntas");')
edit("src/app/(app)/perfil/actions.ts",'const USER_TABLES = ["menuya_profiles"] as const;','// El perfil va al
final (al borrarlo se pierde el consentimiento).\nconst USER_TABLES = ["menuya_events", "menuya_profiles"] as
const;')
EOF
cat > "src/app/(app)/inicio/page.tsx" <<'EOF'
import Link from "next/link";
import { redirect } from "next/navigation";
```

```
import { DemoLabel } from "@/components/DemoLabel";

La puntuación es correcta en los 9 casos y lint pasa. Actualizo DECISIONS.md con todo lo de hoy y hago commit y push:

Herramienta: Bash — Update decisions, commit and push Feature 3

```
python3 - <<'EOF'
p="docs/DECISIONS.md"; s=open(p).read()
old="MenúYA's code never touches those tables. Owner decides whether to tighten mapa-tandeo's policies."
assert old in s
s=s.replace(old, old+"\n  - **Known risk, accepted by owner (2026-11-03): do NOT change mapa-tandeo's policies
yet. Fix after Week 11 is graded.**")
s+='''
## 2026-11-03 — Domain, Supabase Pro, grants, Google branding check, Feature 3

**Domain**
- `menuyamx.xyz` bought in Vercel (Vercel DNS, expires 2027-11-03), attached to project `menuya`. Verified it
serves the latest production deploy (`menuya-qqaalb76v…`, commit `e3ef780`). **URL of record:
https://menuyamx.xyz.** `www.menuyamx.xyz` is not configured.
- Owner added MenúYA's Redirect URLs in mapa-tandeo (incl. `https://menuyamx.xyz/**`).

**Supabase Pro**
- Owner is on Pro. Asked to reactivate only `peldano`, `mi-total`, `peldano-venture`. Not done by Claude: the
CLI has no restore command and the Management API token lives in the macOS keychain (access denied). Owner
```

```
restores them from the dashboard.

**Grants (Supabase Data API change, enforced on existing projects from 2026-10-30)**
- New tables in `public` need explicit `GRANT`s. MenúYA tables: `authenticated` gets only `select, insert,
update, delete` (events: no update), `anon` gets nothing, `service_role` full, RLS on.
- Found and fixed: `menuya_profiles` had inherited `TRUNCATE/TRIGGER/REFERENCES` for `authenticated` from the
project's default privileges (`TRUNCATE` ignores RLS) → `db/migrations/002_menuya_grants.sql`. Default
privileges and mapa-tandeo tables untouched (mapa-tandeo tables still grant everything to `anon` and
`authenticated`, part of the known risk above).
- Every future `menuya_` migration starts with `revoke all … from anon, authenticated` + explicit grants.

**Google login check (read-only)** — see the session summary for the per-project table. Two Google Cloud
projects identified by Client ID prefix (project number): `703858706779` (quien-rompe-paga), `1092950307708`
(mapa-tandeo, also used by MenúYA). peldano / mi-total / peldano-venture could not be read while paused. Only
peldano.xyz has a public `/privacidad` page.

**Feature 3 — on-device ELCSA + comedores referral**
- `menuya_events` created early (it's Feature 5's table) because Feature 3 must log `elcsa_completed`. RLS:
insert/select/delete own rows; `name` 1–40 chars; `props` must be an object ≤ 2 KB. Also logging `signed_in`
(callback) and `consent_given` (consent).
- Flow: consent → `/preguntas` (ELCSA) → `/inicio`. `/inicio` redirects to `/preguntas` until an
`elcsa_completed` event exists.
- ELCSA: FAO/ELCSA adult-household version, 8 yes/no, last 3 months. Answers live only in React state; cleared
as soon as the level is computed. Scoring 0 seguridad / 1–3 leve / 4–6 moderada / 7–8 severa (tested 0–8).
- Server learns only "completed": the server action takes **no arguments**. Both outcomes call the same action
and end with the same "Continuar" → `/inicio`; the comedores screen is rendered inside the same client component
(no route change), so URLs, requests and server logs don't reveal the result.
- The level lives in a React context (`ElcsaProvider`) in tab memory only. `useCanShowPay()` is true **only** if
ELCSA was answered in this tab with seguridad/leve. Default (reload, new tab, not answered) = no price, no pay
button. Feature 5 must use `useCanShowPay()` for every price/pay element; if hidden, offer "answer the 8
questions again".
- Comedores screen: no prices. SIBISO comedores sociales/comunitarios, Locatel 55 5658 1111, Red BAMX, with
"verifica en los sitios oficiales".
- "Borrar mis datos" now also deletes `menuya_events`.

**Pending**
- Owner: restore `peldano`, `mi-total`, `peldano-venture` in the Supabase dashboard; then re-read their Google
Client IDs.
- End-to-end sign-in test with a real Google account on https://menuyamx.xyz.
- Google branding fixes per project (privacy policy pages missing on 4 sites; weeks 8–12 code must not change →
owner decides).

**Tomorrow's first move**
- Sign in end-to-end on https://menuyamx.xyz (profile row, `signed_in`, `consent_given`, `elcsa_completed` with
empty props), then Feature 4 (baseline + daily logs).

Claude · 03/11/2026 16:31

Hice los pasos 1, 3, 4 y 5. El paso 2 (reactivar proyectos) no lo pude hacer. Las políticas de mapa-tandeo quedaron sin cambios y anotadas en `docs/DECISIONS.md` como riesgo conocido, a corregir después de que califiquen la semana 11. No toqué nada de las semanas 8 a 12.

1. Dominio: listo. menuyamx.xyz apunta al último deploy, que ya incluye la Feature 3.

`www.menuyamx.xyz` no está configurado.

2. Reactivar peldano, mi-total y peldano-venture: no lo hice. El CLI de Supabase no tiene comando para reactivar, y el token de la API está en el llavero, donde el permiso me fue denegado. Hazlo tú desde el dashboard: abre cada uno de esos tres proyectos → **Restore project**. No toqué ningún otro.

3. GRANTs: listo, solo en tablas `menuya_`:
- **Qué exige el cambio:** desde el 30 de octubre, la API de Supabase solo ve las tablas nuevas de `public` con GRANT explícito.
- **Lo que corregí:** `menuya_profiles` había heredado `TRUNCATE` para usuarios con sesión, y `TRUNCATE` se salta RLS. Ahora `authenticated` solo tiene SELECT/INSERT/UPDATE/DELETE y `anon` no tiene nada (migración `002`). `menuya_events` nace igual, sin UPDATE.
- **Estado:** RLS activo en ambas. Las tablas de mapa-tandeo siguen igual.

4. Login de Google (solo lectura):

App	Proyecto de Google Cloud (número, del Client ID)	URL pública	Home page	Privacy policy	Authorised domains
quien-rompe-paga	703858706779	https://quien-rompe-paga.vercel.app	esa URL	❌ el sitio no tiene página	`quien-rompe-paga.vercel.app`, `nldfkihypbfmeqnwomvb.supabase.co`
peldano / pelda-o	⏳ pausado, no se pudo leer	https://pelda-o.vercel.app	esa URL	❌ no tiene	`pelda-o.vercel.app`, `hwyrawbwsjrpecoyvqax.supabase.co`
mi-total	⏳ pausado	https://mi-total.vercel.app	esa URL	❌ no tiene	`mi-total.vercel.app`, `puedicsujjravjiszejf.supabase.co`
mapa-tandeo (y MenúYA)	1092950307708	https://mapa-tandeo.vercel.app	esa URL	❌ no tiene	`mapa-tandeo.vercel.app`, `menuyamx.xyz`, `icohpikxtlqhkpvmvtuv.supabase.co`
peldano-venture / peldano.xyz	⏳ pausado	https://peldano.xyz	esa URL	https://peldano.xyz/privacidad	`peldano.xyz`, `okiebjcsugsroshxmovf.supabase.co`

- **Nombre del proyecto:** el número se busca en el selector de proyectos de Google Cloud Console.
- **Los pausados:** cuando los reactives, puedo sacar su Client ID.
- **Privacidad y dominios:** para publicar la app en Google necesitas una página de privacidad pública, y solo peldano.xyz la tiene. Google también suele pedir verificar que eres dueño del dominio, y en `*.vercel.app` eso requiere un cambio de código, que no hice.
- **MenúYA:** tampoco tiene una página de privacidad pública todavía, porque `/aviso` requiere iniciar sesión.

5. Feature 3: commit `feat: on-device ELCSA + comedores referral`, en línea en https://menuyamx.xyz.
- **Flujo:** consentimiento → 8 preguntas ELCSA → inicio.
- **Puntuación:** se calcula solo en la memoria del navegador; la probé de 0 a 8 "sí" y los umbrales salen bien. Al servidor solo llega `elcsa_completed`, sin puntaje ni respuestas.
- **Comedores:** con resultado moderado o severo se muestra la pantalla de comedores sin precios, en la misma ruta y con el mismo botón "Continuar" que los demás, así el servidor no puede deducir el resultado.
- **Pago:** el botón solo podrá aparecer si en esa pestaña salió seguridad o leve; por defecto queda oculto.
- **Adelanto de la Feature 5:** creé `menuya_events` antes de tiempo porque la Feature 3 necesita registrar `elcsa_completed`. Ya se registran también `signed_in` y `consent_given`.
- **Pendiente:** compila, pasa lint, y sin sesión las páginas protegidas mandan a `/entrar`. Todavía no se ha probado con una cuenta real de Google.

Usuario · 03/11/2026 17:04

No publiques ni cambies nada de Google en las entregas viejas. Para MenúYA: haz pública la página del aviso de privacidad en https://menuyamx.xyz/privacidad (sin pedir sesión) y enlázala desde la landing y la pantalla de consentimiento. Luego sigue con la Feature 4 de docs/BUILD_PROMPT.md, y después la 5 y la 6. Haz commit y deploy después de cada una.

Claude · 03/11/2026 17:04

Empiezo con la página pública de privacidad. Saco el texto del aviso a un componente compartido para que `/privacidad` y la pantalla de consentimiento muestren el mismo contenido.

Herramienta: Read

```
{
 "file_path": "/Users/dulcegil/menuya-w13/src/app/aviso/page.tsx"
}
```

`/privacidad` ya es pública (200 sin sesión) y está enlazada desde la landing y desde el consentimiento. Sigo con la **Feature 4**; primero la migración de las 3 tablas:

Herramienta: Bash — Create baseline and log tables with RLS

```
cat > db/migrations/004_menuya_logs.sql <<'EOF'
-- MenúYA · 004 · línea base + registros diarios. Solo objetos menuya_.

create table if not exists public.menuya_baseline_orders (
  id         bigint generated always as identity primary key,
  user_id    uuid not null default auth.uid() references auth.users (id) on delete cascade,
  label      text not null check (label in ('antojo','no_planee','no_tuve_tiempo','alcohol_tabaco','otro')),
  amount_mxn int  not null check (amount_mxn between 0 and 2000),
  created_at timestamptz not null default now()
);

create table if not exists public.menuya_waste_logs (
  id         bigint generated always as identity primary key,
  user_id    uuid not null default auth.uid() references auth.users (id) on delete cascade,
  log_date   date not null,
  item       text not null check (char_length(item) between 1 and 60),
  amount_mxn int  not null check (amount_mxn between 0 and 2000),
  week       smallint not null check (week in (1,2)),
  created_at timestamptz not null default now()
);

create table if not exists public.menuya_impulse_logs (
  id         bigint generated always as identity primary key,
  user_id    uuid not null default auth.uid() references auth.users (id) on delete cascade,
  log_date   date not null,
  kind       text not null check (kind in ('delivery','oxxo','otro')),
  amount_mxn int  not null check (amount_mxn between 0 and 2000),
  week       smallint not null check (week in (1,2)),
  created_at timestamptz not null default now()
);

create index if not exists menuya_baseline_orders_user_idx on public.menuya_baseline_orders (user_id);
create index if not exists menuya_waste_logs_user_date_idx on public.menuya_waste_logs (user_id, log_date);
create index if not exists menuya_impulse_logs_user_date_idx on public.menuya_impulse_logs (user_id, log_date);

do $$
declare t text;
begin
  foreach t in array array['menuya_baseline_orders','menuya_waste_logs','menuya_impulse_logs'] loop
    execute format('alter table public.%I enable row level security', t);
    execute format('drop policy if exists %I on public.%I', t || '_select', t);
    execute format('drop policy if exists %I on public.%I', t || '_insert', t);

Compila. Pruebo la validación zod con los casos de la PACKET (-5, abc, 999999, 500 caracteres):

Herramienta: Bash — Run zod validation edge-case tests

```
S=/private/tmp/claude-501/-Users-dulcegil-menuya-w13/0137ff9c-2ce3-4859-acbc-08f251deef39/scratchpad; cat >
$S/val-test.mts <<'EOF'
import { wasteSchema, impulseSchema, baselineSchema } from "/Users/dulcegil/menuya-w13/src/lib/validation.ts";
const cases: [string, unknown][] = [
  ["monto -5", { item: "pan", amount_mxn: "-5", when: "hoy" }],
  ["monto abc", { item: "pan", amount_mxn: "abc", when: "hoy" }],
  ["monto 999999", { item: "pan", amount_mxn: "999999", when: "hoy" }],
  ["monto 12.5", { item: "pan", amount_mxn: "12.5", when: "hoy" }],
  ["item 500 chars", { item: "x".repeat(500), amount_mxn: "20", when: "hoy" }],
  ["item vacío", { item: "   ", amount_mxn: "20", when: "hoy" }],
  ["fecha inválida", { item: "pan", amount_mxn: "20", when: "mañana" }],
  ["VÁLIDO pan $28", { item: "pan", amount_mxn: "28", when: "hoy" }],
  ["VÁLIDO $0 y $2000", { item: "a", amount_mxn: "2000", when: "ayer" }],
];
for (const [n, v] of cases) { const r = wasteSchema.safeParse(v); console.log(n.padEnd(18), r.success ?
"ACEPTADO" : "RECHAZADO: " + r.error.issues.map(i => i.message).join(" | ")); }
const k = impulseSchema.safeParse({ kind: "rappi", amount_mxn: "50", when: "hoy" }); console.log("kind
rappi".padEnd(18), k.success ? "ACEPTADO" : "RECHAZADO: " + k.error.issues[0].message);
const b = baselineSchema.safeParse(Array(11).fill({ label: "antojo", amount_mxn: "100" }));
console.log("baseline 11".padEnd(18), b.success ? "ACEPTADO" : "RECHAZADO: " + b.error.issues[0].message);
const b2 = baselineSchema.safeParse([{ label: "hambre", amount_mxn: "100" }]); console.log("label
inválido".padEnd(18), b2.success ? "ACEPTADO" : "RECHAZADO: " + b2.error.issues[0].message);
EOF
node --no-warnings $S/val-test.mts 2>&1 | tee $S/val-results.txt
```

Resultado

```
monto -5           RECHAZADO: El monto no puede ser negativo. | Escribe solo números enteros, sin $, puntos ni
letras.
monto abc          RECHAZADO: Escribe solo números enteros, sin $, puntos ni letras.
monto 999999       RECHAZADO: El máximo por registro es $2,000.
monto 12.5         RECHAZADO: Escribe solo números enteros, sin $, puntos ni letras.
item 500 chars     RECHAZADO: Máximo 60 caracteres.
item vacío         RECHAZADO: Escribe qué tiraste.
fecha inválida     RECHAZADO: Elige si fue hoy o ayer.
VÁLIDO pan $28     ACEPTADO
VÁLIDO $0 y $2000  ACEPTADO
```

```
kind rappi         RECHAZADO: Elige qué tipo de compra fue.
baseline 11        RECHAZADO: Máximo 10 pedidos.
label inválido     RECHAZADO: Elige por qué hiciste ese pedido.
```

Claude · 03/11/2026 17:08

Todo se rechaza con mensaje en español. Mejoro algo de usabilidad: aceptar "$150" o "1,500" quitando `$` y comas antes de validar (los decimales siguen rechazados):

Herramienta: Bash — Normalize amount input and retest

```
python3 - <<'EOF'
p="src/lib/validation.ts"; s=open(p).read()
old='''  .trim()
  .min(1, { error: "Escribe el monto en pesos." })
  .refine((v) => !v.startsWith("-")'''
assert old in s
s=s.replace(old,'''  .trim()
  .transform((v) => v.replace(/[$,\\s]/g, "")) // acepta "$150" o "1,500"
  .pipe(z.string().min(1, { error: "Escribe el monto en pesos." }))
  .refine((v) => !v.startsWith("-")''')
open(p,"w").write(s)
EOF
S=/private/tmp/claude-501/-Users-dulcegil-menuya-w13/0137ff9c-2ce3-4859-acbc-08f251deef39/scratchpad; cat >
$S/val-test2.mts <<'EOF'
import { amountSchema } from "/Users/dulcegil/menuya-w13/src/lib/validation.ts";
for (const v of ["$150", "1,500", " 28 ", "-5", "abc", "999999", "12.5", "", "$2,001"]) { const r =
amountSchema.safeParse(v); console.log(JSON.stringify(v).padEnd(10), r.success ? "ACEPTADO → " + r.data :
"RECHAZADO: " + r.error.issues[0].message); }
EOF
node --no-warnings $S/val-test2.mts; node --no-warnings $S/val-test.mts > $S/val-results.txt; npx eslint . &&
npm run build 2>&1 | grep -E "Compiled|rror"
```

Resultado

```
"$150"     ACEPTADO → 150
"1,500"    ACEPTADO → 1500
" 28 "     ACEPTADO → 28
"-5"       RECHAZADO: El monto no puede ser negativo.
"abc"      RECHAZADO: Escribe solo números enteros, sin $, puntos ni letras.
"999999"   RECHAZADO: El máximo por registro es $2,000.
"12.5"     RECHAZADO: Escribe solo números enteros, sin $, puntos ni letras.
""         RECHAZADO: Escribe el monto en pesos.
"$2,001"   RECHAZADO: El máximo por registro es $2,000.

```

Herramienta: Bash — Fix message, update decisions, commit Feature 4

```
sed -i '' 's/Escribe solo números enteros, sin \$, puntos ni letras\./Escribe solo números enteros, sin
decimales ni letras./' src/lib/validation.ts && grep -c "sin decimales ni letras" src/lib/validation.ts && cat
>> docs/DECISIONS.md <<'EOF'

## 2026-11-03 — Public privacy page + Feature 4

**Public privacy page**
- https://menuyamx.xyz/privacidad, no sign-in (added to the proxy's public paths). Same text as the consent
screen (`src/components/PrivacyNotice.tsx`, single source). Linked from the landing and the consent screen. This
is MenúYA's privacy policy URL for Google Branding. Nothing changed in Google for any older project (owner's
rule).

**Feature 4 — baseline + daily logs**
- Tables (migration `004`): `menuya_baseline_orders`, `menuya_waste_logs`, `menuya_impulse_logs`. `user_id
default auth.uid()`, the check constraints from BUILD_PROMPT, RLS select/insert/delete own rows, explicit GRANTs
(authenticated: select/insert/delete; no anon; no update: a wrong entry is deleted and re-entered).
- Flow: consent → ELCSA → `/linea-base` → `/inicio`. Guards in `src/lib/onboarding.ts`. ELCSA "Continuar" goes
to `/linea-base` for every outcome.
- Baseline: 10 rows (label + amount). Accepts 1–10 filled rows ("si tienes menos de 10, llena los que tengas"),
so nobody gets stuck. Saved only once; logs `baseline_done` with `{orders: n}`.
- **14-day test window: day 1 = the CDMX date the baseline was saved.** Days 1–7 = week 1, 8–14 = week 2. `week`
is computed on the server, never sent by the client. Logs outside the window are rejected.
- All dates use America/Mexico_City (not the server's UTC), so a log at 11 pm CDMX lands on the right day.
- Log forms: "🗑️ Tiré comida" (item 1–60 chars + amount) and "🛵 Pedí algo / compra no planeada" (delivery /
OXXO / otro + amount), each for "hoy" or "ayer".
- Added "✅ Hoy no tiré nada ni compré de más": stores a $0 waste row ("Nada hoy") so a clean day counts toward
"X de 7 días registrados". Without it, the adherence bar would punish people who didn't waste anything.
- Amounts: whole pesos 0–2000. "$150" and "1,500" are accepted (the `$` and commas are stripped); "-5", "abc",
"12.5", "999999" are rejected with Spanish messages. Item > 60 chars rejected. The DB checks back up the same
limits.
- Home: "Tu semana N · X de 7 días registrados", "Día N de 14", progress bar, "Registrar hoy" banner when
nothing is logged today, the two big buttons, today's list with "Borrar".
- "Borrar mis datos" now covers all 5 `menuya_` tables.

**Tomorrow's first move**
```

```
- Feature 5 (saving screen, Mi lista, pay button gated by `useCanShowPay()`).

Feature 4 en línea (deploy del commit `24eed44`). Sigo con la **Feature 5**. Primero, el cálculo del ahorro como función pura para poder probarlo:

Herramienta: Bash — Write saving logic and list data, run math tests

```
mkdir -p src/data && cat > src/lib/saving.ts <<'EOF'
// Cálculo del ahorro: función pura (sin red, sin base de datos) para poder probarla con datos sembrados.
import { weekFor, daysBetween } from "./dates";

export const GOAL_MXN = 60;

type Log = { log_date: string; amount_mxn: number };
type Baseline = { label: string; amount_mxn: number };

export type Saving = {
  status: "sin_inicio" | "semana1" | "semana2_parcial" | "final";
  week1Total: number;
  week2Total: number;
  /** Días comparados (en semana 2 parcial se comparan los mismos días de ambas semanas). */
  daysCompared: number;
  /** semana 1 − semana 2, en pesos. Puede ser negativo. */
  saving: number;
  goalMet: boolean;
  /** 0–1 para la barra. */
  progress: number;
  alcoholTabaco: { count: number; amount: number };
};

export function computeSaving(input: {
  startDate: string | null;
  today: string;
  waste: Log[];
  impulse: Log[];
  baseline: Baseline[];
}): Saving {
  const alcohol = input.baseline.filter((b) => b.label === "alcohol_tabaco");
  const alcoholTabaco = { count: alcohol.length, amount: alcohol.reduce((s, b) => s + b.amount_mxn, 0) };
  const empty = { week1Total: 0, week2Total: 0, daysCompared: 0, saving: 0, goalMet: false, progress: 0,

Node no resuelve imports sin extensión. Agrego `tsx` como dependencia de desarrollo y paso las pruebas al repo (`tests/`), así se pueden volver a correr en la Feature 6:

Herramienta: Bash — Add tsx, unit tests for saving, ELCSA, validation

```
npm i -D tsx 2>&1 | tail -1 && mkdir -p tests && cat > tests/saving.test.ts <<'EOF'
import { test } from "node:test";
import assert from "node:assert/strict";
import { computeSaving } from "../src/lib/saving";
import { addDays } from "../src/lib/dates";

// Datos de demostración sembrados (PACKET 11A.6): semana 1 = $200, semana 2 = $120.
const start = "2026-11-01";
const waste = [
  { log_date: addDays(start, 0), amount_mxn: 50 },
  { log_date: addDays(start, 3), amount_mxn: 30 },
  { log_date: addDays(start, 8), amount_mxn: 40 },
];
const impulse = [
  { log_date: addDays(start, 5), amount_mxn: 120 },
  { log_date: addDays(start, 12), amount_mxn: 80 },
];
const baseline = [
  { label: "alcohol_tabaco", amount_mxn: 180 },
  { label: "alcohol_tabaco", amount_mxn: 95 },
  { label: "antojo", amount_mxn: 150 },
];

test("11A.6: semana 1 $200 vs semana 2 $120 → $80 y pasa la meta", () => {
  const s = computeSaving({ startDate: start, today: addDays(start, 14), waste, impulse, baseline });
  assert.equal(s.status, "final");
  assert.equal(s.week1Total, 200);
  assert.equal(s.week2Total, 120);
  assert.equal(s.saving, 80);
  assert.equal(s.goalMet, true);
  assert.equal(s.progress, 1);
});

test("alcohol/tabaco se cuenta aparte", () => {
  const s = computeSaving({ startDate: start, today: addDays(start, 14), waste, impulse, baseline });
  assert.deepEqual(s.alcoholTabaco, { count: 2, amount: 275 });
});

test("debajo de la meta se reporta tal cual ($30)", () => {

Todo compila y las pruebas pasan. Anoto en DECISIONS, hago commit y push (Deploy 2):

Herramienta: Bash — Commit Feature 5, push, wait for Deploy 2

```
cat >> docs/DECISIONS.md <<'EOF'

## 2026-11-03 — Feature 5: saving screen + price trust + event log (Deploy 2)

**Decisions**
- `menuya_events` already existed (created in Feature 3). Events now written: `signed_in`, `consent_given`,
`elcsa_completed`, `baseline_done`, `log_added` (`{type: waste|impulse|nothing, week}`), `saving_viewed`,
`pay_link_clicked`. Names are a fixed zod enum on the server; the client can't pick what gets logged.
`saving_viewed` fires once per screen visit from a client effect (a ref guard stops duplicates), not on render,
so prefetching can't log it.
- Saving math is a pure function (`src/lib/saving.ts`) with unit tests (`npm test`). Saving = week 1 total −
week 2 total (waste + impulse). **During week 2 it compares only the same number of days from both weeks**, so
an early, half-empty week 2 can't fake a big saving. The final number appears from day 15.
- Honest copy: ≥ $60 "¡Pasaste la meta!"; below $60 "Te faltaron $X…"; negative "gastaste $X más…". The bar
never goes below 0.
- Alcohol/tabaco: count + amount from the baseline orders labeled `alcohol_tabaco`, shown in its own card ("Lo
que un plan de comidas no arregla") and never counted as possible saving.
- Mi lista: static, whitelisted basics only (frijol, tortilla, huevo, arroz, jitomate, calabacita, cebolla,
naranja and guayaba as seasonal produce). No NOM-051 sealed products. Each item shows a price range + "captura:
dic 2025". Bottom line is "Máximo esperado: $X" (sum of the maximums), never one exact total. Labeled "Precio de
referencia (demo)". Prices are **invented**.
- Pay button: "Apoyar MenúYA · $149 por semestre, sin renovación automática" → `NEXT_PUBLIC_PAY_LINK` (set in
`.env.local` + Vercel for all environments to the placeholder https://menuyamx.xyz/pago-pendiente, which is
public and says "no se te cobró nada"). Owner swaps in the Mercado Pago link later with `vercel env add
NEXT_PUBLIC_PAY_LINK … --force` + redeploy.
- Pay button gating (`useCanShowPay()`):
  - Shown only if this tab's memory holds an ELCSA result of seguridad/leve.
  - Moderada/severa in this session: nothing at all (no price, no button, no hint).
  - No result in memory (reload, new day): a link "contesta otra vez las 8 preguntas" instead of the price.
- ⚠️ Interpretation for the owner to confirm: "no price anywhere" for moderate/severe is read as **no MenúYA
price ($149) and no pay button**. Reference grocery price ranges in Mi lista stay visible to everyone (they sell
nothing and help a tight budget). If you want them hidden too, it's a one-line change in `lista/page.tsx`.
- Bottom nav (Inicio, Lista, Ahorro, Perfil) only on those 4 screens, not during onboarding or the forms. "Plan"
from the mockup is left out: no plan feature this week (scope cut).

**Tomorrow's first move**
- Feature 6: mechanical test pass → `docs/TEST_RESULTS.md`, fix ≥ 1 bug, Deploy 3.

Claude · 03/11/2026 17:15

21/21 pruebas pasan y la prueba RLS/SQL ya no tiene ningún ❌. Agrego una prueba de humo contra producción, hago el commit del fix y el Deploy 3:

Claude · 03/11/2026 17:31

API Error: Your computer went to sleep mid-response. The response above may be incomplete.

Usuario · 04/11/2026 11:36

La compu se durmió a mitad de tu respuesta. Haz esto en orden:
1. Revisa con git status qué quedó sin commit, termina el commit del fix y el Deploy 3.
2. Mueve ~/Downloads/Mockup.png a docs/mockup.png y en docs/PACKET.md reemplaza la línea `![Contador de Ahorro mockup](mockup.png)` (la que está entre comillas invertidas) por la imagen real: ![Contador de Ahorro mockup](mockup.png). Commit.
3. Sigue con la Feature 6 de docs/BUILD_PROMPT.md (test pass).
Para tu info: ya reactivé peldano y mi-total, y probé el login de MenúYA en menuyamx.xyz con

josep.builds@gmail.com: funciona. Cuando termines, dame un resumen corto y la lista de pantallas en orden para el persona test.

Herramienta: Bash — Check uncommitted changes and mockup file

```
git status --short; git log --oneline -3; ls -la ~/Downloads/Mockup.png 2>&1; file ~/Downloads/Mockup.png 2>&1
```

Resultado

```

Claude · 04/11/2026 11:36

El fix entero está en el working tree, solo falta el commit. Confirmo que la migración 005 sigue aplicada, corro pruebas y build, y hago commit:

Herramienta: Bash — Verify, test, build and commit the fix

```
supabase db query --linked --project-ref icohpikxtlqhkpvmvtuv "select conname from pg_constraint where
conrelid='public.menuya_events'::regclass and conname like 'menuya_events_%allowed'" 2>&1 | grep conname; npm
test 2>&1 | grep -E "^ℹ (pass|fail)"; npx eslint . && npm run build 2>&1 | grep -E "Compiled|rror" && git add -A
&& git commit -q -m "fix: DB accepted any event name/props (could store an ELCSA score via the API)

Whitelist the 7 event names and the props keys (type, week, orders) with
check constraints on menuya_events, matching a strict zod schema on the
server. Found by the two-user RLS test (tests/rls_test.sql).

Co-Authored-By: Claude Opus 5.5 <noreply@anthropic.com>" && git push -q && git log --oneline -1
```

Resultado

```
      "conname": "menuya_events_name_allowed"
      "conname": "menuya_events_props_allowed"
ℹ pass 21
ℹ fail 0
✓ Compiled successfully in 1299ms
da05a70 fix: DB accepted any event name/props (could store an ELCSA score via the API)
```

Claude · 04/11/2026 11:36

Mientras se despliega, paso al punto 2 (mockup). Primero miro la imagen y la línea exacta en PACKET.md:

Herramienta: Bash — Find mockup line in PACKET

```
grep -n "mockup.png" docs/PACKET.md
```

Herramienta: Read

```
{
 "file_path": "/Users/dulcegil/Downloads/Mockup.png"
}
```

Resultado

```
36:Prompt to paste into the LLM's image generator (save the result as `docs/mockup.png` and embed it here):
40:`![Contador de Ahorro mockup](mockup.png)`
```

Resultado

```
[imagen]
```

Herramienta: Bash — Move mockup, embed in PACKET, commit

```
mv ~/Downloads/Mockup.png docs/mockup.png && sed -i '' '40s/^`!\[Contador de Ahorro mockup\](mockup.png)`$/!
[Contador de Ahorro mockup](mockup.png)/' docs/PACKET.md && sed -n 40p docs/PACKET.md && ls -la docs/mockup.png
~/Downloads/Mockup.png 2>&1 | head -3 && git add docs/mockup.png docs/PACKET.md && git commit -q -m "docs: embed
Contador de Ahorro mockup in PACKET

Co-Authored-By: Claude Opus 5.5 <noreply@anthropic.com>" && git push -q && git log --oneline -1
```

Resultado

```
![Contador de Ahorro mockup](mockup.png)
ls: /Users/dulcegil/Downloads/Mockup.png: No such file or directory
-rw-r--r--@ 1 dulcegil  staff  1578783  4 nov 11:34 docs/mockup.png
1f568ea docs: embed Contador de Ahorro mockup in PACKET
[This command modified 1 file you've previously read: docs/PACKET.md. Call Read before editing.]
```

Claude · 04/11/2026 11:38

Mockup listo. Espero el Deploy 3 y reviso en la base los datos del login real que hiciste con josep.builds@gmail.com. Solo leo conteos agregados de las tablas `menuya_`, sin datos personales.

Herramienta: Bash — Wait for Deploy 3 to be Ready

```
cd /private/tmp && for i in $(seq 1 60); do d=$(vercel ls menuya --prod 2>/dev/null | grep vercel.app | head
-1); m=$(vercel api "/v13/deployments/${d#https://}" 2>/dev/null | node -e 'let
s="";process.stdin.on("data",x=>s+=x).on("end",()=>{try{const j=JSON.parse(s);console.log((j.meta||
{}).githubCommitSha?.slice(0,7)+" "+j.readyState)}catch(e){console.log("?")}})'); case "$m" in 1f568ea\
READY|1f568ea\ ERROR|da05a70\ READY*) [ "${m%% *}" = 1f568ea ] && break;; esac; sleep 6; done; echo "$d $m";
vercel inspect https://menuyamx.xyz 2>&1 | grep -E "^\s+url"
```

Herramienta: Bash — Aggregate counts of real MenúYA data

```
supabase db query --linked --project-ref icohpikxtlqhkpvmvtuv "select 'profiles' t, count(*) n,
count(consent_at) extra from public.menuya_profiles union all select 'events:'||name, count(*), count(distinct
user_id) from public.menuya_events group by name union all select 'baseline', count(*), count(distinct user_id)
from public.menuya_baseline_orders union all select 'waste', count(*), count(distinct user_id) from
public.menuya_waste_logs union all select 'impulse', count(*), count(distinct user_id) from
public.menuya_impulse_logs union all select 'events con props', count(*), 0 from public.menuya_events where
props <> '{}'::jsonb order by 1" 2>&1 | grep -E '"(t|n|extra)"' | paste - - - | sed 's/  */ /g'
```

Resultado

Prueba de humo: 33/33 ✅. Vuelvo a correr la prueba RLS para dejar sus resultados en el reporte, y escribo `docs/TEST_RESULTS.md`:

Herramienta: Bash — Collect final RLS and unit test results

```
S=/private/tmp/claude-501/-Users-dulcegil-menuya-w13/0137ff9c-2ce3-4859-acbc-08f251deef39/scratchpad; supabase
db query --linked --project-ref icohpikxtlqhkpvmvtuv -f tests/rls_test.sql 2>&1 | grep -o 'RESULTADOS[^"]*' |
sed 's/RESULTADOS (todo revertido): //; s/\] \[/]\n[/g; s/\\n.*//' > $S/rls.txt; wc -l < $S/rls.txt; grep -c
"❌" $S/rls.txt; npm test 2>&1 | grep -E "^✔|^✖" | sed 's/ ([0-9.]*ms)//' > $S/unit.txt; wc -l < $S/unit.txt;
supabase db query --linked --project-ref icohpikxtlqhkpvmvtuv "select count(*) n from auth.users where email
like '%@test.invalid'" 2>&1 | grep '"n"'
```

Resultado

```
      31
0
      21
      "n": 0
```

Herramienta: Bash — Write TEST_RESULTS.md with all results

```
S=/private/tmp/claude-501/-Users-dulcegil-menuya-w13/0137ff9c-2ce3-4859-acbc-08f251deef39/scratchpad; { cat
<<'EOF'
# MenúYA · Week 13 — TEST_RESULTS (mechanical pass, PACKET §11A)

**Date:** 2026-11-04 · **Build tested:** Deploy 3, commit `1f568ea` (includes fix `da05a70`) on
https://menuyamx.xyz
**How to re-run:** `npm test` (unit/static) · `bash tests/smoke.sh` (production, no session) · `supabase db
query --linked --project-ref icohpikxtlqhkpvmvtuv -f tests/rls_test.sql` (two-user RLS, always rolled back)

## Summary

| # | PACKET 11A test | Result | How |
|---|---|---|---|
| 1 | Google sign-in on a fresh browser → profile row created, consent required before any log screen | ✅ PASS
| Owner signed in on menuyamx.xyz with a real Google account (2026-11-04). DB: 1 `menuya_profiles` row with
`consent_at`, exactly 1 `signed_in`, 1 `consent_given`. Smoke test: all 8 app screens redirect to `/entrar`
without a session; the `(app)` layout requires `consent_at`. |
| 2 | RLS: user B tries to read user A's rows → 0 rows | ✅ PASS | `tests/rls_test.sql`: B reads 0 rows, deletes
0 rows and edits 0 rows of A's in all 5 `menuya_` tables. Inserting as A is blocked. `anon` has no permission on
any table (SQL + REST API). |
| 3 | Validation: "-5", "abc", "999999", 500-char text → rejected with a Spanish message | ✅ PASS | zod unit
tests + DB check constraints (both layers). |
| 4 | ELCSA: no request contains answers | ✅ PASS (static + DB) · ⏳ manual DevTools check pending | The server
action takes no arguments, and the ELCSA code has no fetch/storage/cookies. Owner's real run left 1
`elcsa_completed` event with **empty props**. |
| 5 | ELCSA moderate/severe → comedores screen, no price or pay button anywhere | ✅ PASS (unit + static) |
`payButtonMode`: moderada/severa → hidden. `$149` and the pay link exist only in `PayButton`. The comedores
screen has no prices. |
| 6 | Saving math: seed week 1 = $200, week 2 = $120 → $80 and "pasaste la meta" | ✅ PASS |
`tests/saving.test.ts`, with seeded demo data, plus below-goal, negative and partial week 2 cases. |
| 7 | Event log: each action writes exactly one event row | ✅ PASS (static + DB) | Static test: exactly one
write site per event/action. DB after the owner's real run: exactly 1 of each event. |
```

```
| 8 | Real domain loads on mobile data, not just Wi-Fi | ⏳ MANUAL | Needs a phone with Wi-Fi off. Over the
internet: menuyamx.xyz serves HTTPS 200 from Vercel. |

**Bug found and fixed (≥ 1 required):** see the "Bug" section. **Deploy 3** done.

## Bug found → fixed

**`menuya_events` accepted any event name and any `props`** (found by `tests/rls_test.sql`, row "DB evento
inventado elcsa_score: ACEPTADO ❌").
- Impact: with only their own session and the public anon key, any user could call the REST API and store, for
example, `{"name": "elcsa_score", "props": {"score": 8}}`. That breaks the "ELCSA never leaves the phone"
promise and the "zod + matching DB checks" rule. The DB only checked `length(name) ≤ 40`.
- Fix (`da05a70`, migration `db/migrations/005_menuya_events_whitelist.sql`):
  - Check constraints: `name` must be one of the 7 events, and `props` can only hold `type`
(waste/impulse/nothing), `week` (1/2) and `orders` (1–10).
  - The server's zod schema is now strict with the same keys.
- Verified: the re-run now rejects both the invented event and the `{"score": 8}` props, and still accepts a
valid `log_added`.
- Before the fix: 0 bad rows in production (checked), so nothing to clean up.

## Detail

### Unit + static tests (`npm test`) — 21/21
```
EOF
cat $S/unit.txt; echo '```'; echo; echo '### Two-user RLS + DB constraints (`tests/rls_test.sql`) — 31 checks, 0
❌, everything rolled back (0 test users left in `auth.users`)'; echo '```'; cat $S/rls.txt; echo '```'; echo;
echo '### Production smoke test (`tests/smoke.sh`, no session) — 33/33'; echo '```'; cat $S/smoke.txt; echo
'```'; cat <<'EOF'

Not automated / pending (manual)
- **11A.4 in a real browser:** answer ELCSA with DevTools → Network open; confirm the only request is the server
action with an empty body `[]`.
- **11A.5 end to end:** answer ≥ 4 "sí" → comedores screen; then open Ahorro: no $149, no button, no hint.
- **11A.8:** open https://menuyamx.xyz on a phone with Wi-Fi off.
- Sign-in with a **second real Google account** (RLS was tested at DB level with two simulated users inside a
rolled-back transaction).

Known risks (not bugs in MenúYA, not changed)
- mapa-tandeo's own tables (`devices`, `readings`, `flags`, `block_week_stats`) are writable by any signed-in
user of the shared Supabase project, MenúYA users included. Accepted by owner; fix after Week 11 is graded.
- A user can write their own `menuya_waste_logs`/`menuya_impulse_logs` directly through the API with any
`week`/`log_date`, which would skew only *their own* saving number. A DB trigger to recompute `week` could close
it later.
EOF
} > docs/TEST_RESULTS.md && wc -l docs/TEST_RESULTS.md && grep -c "❌" docs/TEST_RESULTS.md
```

**Resultado**

```
     138 docs/TEST_RESULTS.md
2
```

Claude · 04/11/2026 11:40

Escribo el cierre en DECISIONS.md, hago commit y push:

Herramienta: Bash — Session close: decisions, commit and push

```
cat >> docs/DECISIONS.md <<'EOF'

## 2026-11-04 — Feature 6: mechanical test pass (Deploy 3) + Session Close

**Done**
- Fix committed after the laptop went to sleep: `da05a70 fix: DB accepted any event name/props…` (migration
`005`: whitelist of the 7 event names + `props` keys, strict zod on the server). Found by the two-user RLS test.
- **Deploy 3:** `1f568ea` on https://menuyamx.xyz (Ready).
- Mockup: `docs/mockup.png` (from Downloads), embedded in `docs/PACKET.md` §4.
- `docs/TEST_RESULTS.md`:
  - PACKET 11A: 1, 2, 3, 6 ✅. 4, 5, 7 ✅ by static checks + DB. 8 manual.
  - 21/21 unit/static tests, 31 RLS/constraint checks with 0 failures, 33/33 production smoke checks.
- Test assets in the repo: `npm test` (tsx + node:test), `tests/rls_test.sql` (always rolled back: leaves 0
rows, 0 test users), `tests/smoke.sh`.
- Owner signed in for real on menuyamx.xyz: 1 profile with consent and exactly 1 `signed_in` / `consent_given` /
`elcsa_completed`, all with empty props.
- Owner reactivated `peldano` and `mi-total` (Supabase Pro).

**Pending**
- Manual tests: ELCSA with DevTools → Network; moderada/severa end to end (no $149 anywhere); menuyamx.xyz on
mobile data; a second real Google account.
- 🐓 Persona test (PACKET 11B) with the screen list. Fix the worst hesitation → `fix:` commit → Deploy 4.
- Swap `NEXT_PUBLIC_PAY_LINK` for the real Mercado Pago link (`vercel env add NEXT_PUBLIC_PAY_LINK production --
```
```

```
force`, then redeploy).
- Confirm the "no price" reading (Mi lista reference prices stay visible for moderada/severa).
- The Google consent screen shows mapa-tandeo's OAuth app name. Older projects' Google branding: owner's rule is
to not touch it.
- Known risks (see TEST_RESULTS): mapa-tandeo policies (fix after Week 11 is graded); users can write their own
logs with any `week` through the API.
- `www.menuyamx.xyz` not configured.

**Tomorrow's first move**
- Run the persona test (Rubén) on https://menuyamx.xyz with the screen list, log every hesitation, fix the worst
one, Deploy 4.

da05a70 fix: DB accepted any event name/props (could store an ELCSA score via the API)
ec416dc feat: weekly saving screen, price ranges, event log
```

Claude · 04/11/2026 11:40

Terminé las tres cosas: el fix y el Deploy 3 están en línea en https://menuyamx.xyz, el mockup ya aparece en la PACKET y la prueba mecánica de la Feature 6 quedó en `docs/TEST_RESULTS.md`.

1. Fix y Deploy 3: el fix del bug estaba completo en el working tree; solo faltaba el commit, y ya está hecho. El Deploy 3 está en Ready.
- **El bug:** la base de datos aceptaba cualquier nombre de evento y cualquier `props`. Un usuario con su propia sesión podía guardar, por ejemplo, un puntaje ELCSA llamando directo a la API, aunque prometemos que ELCSA no sale del teléfono.
- **La corrección:** ahora la base solo acepta los 7 eventos de la app y sus 3 campos permitidos, igual que la validación zod del servidor.

2. Mockup: está en `docs/mockup.png` y la línea de `PACKET.md` ya muestra la imagen real.

3. Feature 6:

Prueba de la PACKET (11A)	Resultado
1. Login → perfil creado y consentimiento obligatorio	✅ Pasa; se confirmó con tu login real
2. RLS con un segundo usuario	✅ B no lee, no borra, no edita ni inserta datos de A; anon no tiene permiso
3. Validación de "-5", "abc", "999999" y texto de 500 caracteres	✅ Rechazados con mensaje en español, tanto en zod como en la base
4. ELCSA no viaja por la red	✅ Revisión del código: no hay envío ni almacenamiento, y tu evento `elcsa_completed` quedó sin props. Falta revisarlo a mano en DevTools
5. Moderada o severa → sin precio ni botón de pago	✅ Pruebas unitarias y revisión del código. Falta probarlo a mano en la app
6. Semana 1 $200 vs semana 2 $120 → $80, "pasaste la meta"	✅ Pasa
7. Un evento por acción	✅ Revisión del código, y en tu login real quedó exactamente uno de cada evento
8. El dominio carga con datos móviles	⏳ Hay que probarlo en un teléfono con el Wi-Fi apagado

- **Totales:** 21/21 pruebas unitarias, 31 revisiones de RLS en la base sin fallas, y 33/33 revisiones de la prueba de humo contra producción.
- **Cómo probé RLS:** con dos usuarios de prueba dentro de una transacción que siempre se revierte, así que no quedó nada en `auth.users`. Por eso falta probar con una segunda cuenta real de Google.
- **Session Close:** `docs/DECISIONS.md` actualizado, commit y push hechos. El push del último commit (solo documentos) dispara otro deploy, y no revisé que quedara en Ready.

Pendientes:
- Las pruebas manuales que marqué arriba.
- El enlace real de Mercado Pago en `NEXT_PUBLIC_PAY_LINK`; hoy apunta a una página que dice que el pago aún no está activo.
- Confirmar si los precios de referencia de "Mi lista" pueden seguir visibles para alguien con resultado moderado o severo. Yo interpreté "sin precio" como sin el precio de $149 de MenúYA.

Pantallas en orden para el persona test (Rubén):
1. `/`: landing con "Empezar" y el enlace al aviso de privacidad
2. `/entrar`: "Entrar con Google"
3. Selector de cuenta de Google. Aquí aparece el nombre de la app OAuth de mapa-tandeo, una posible duda para Rubén.
4. `/aviso`: aviso de privacidad, ciudad, gasto mensual y "Acepto"
5. `/preguntas`: la intro y las preguntas 1 a 8 (con una captura basta, más la última)
6. El resultado: "¡Gracias!" (6a) o la pantalla de comedores (6b), según las respuestas
7. `/linea-base`: etiquetar los últimos 10 pedidos
8. `/inicio` vacío: "Tu semana 1 · 0 de 7" y el aviso "Registrar hoy"
9. `/registrar?tipo=tire`: 🗑 Tiré comida (vale la pena una captura con un error de validación)
10. `/registrar?tipo=pedi`: 🛵 Pedí algo / compra no planeada
11. `/inicio` con los registros de hoy
12. `/lista`: rangos de precio y "Máximo esperado"
13. `/ahorro`: en semana 1 dice "estamos midiendo", más el botón de $149 si el resultado fue bajo
14. `/pago-pendiente`: lo que se ve al tocar el botón de pago
15. `/perfil`: "Salir" y "Borrar mis datos"
16. `/privacidad`: aviso público

La pantalla 13 con un ahorro en pesos (como el mockup) solo aparece desde la semana 2 de registros. Si la quieres para el persona test, necesito sembrar datos de demostración en tu cuenta. Dime si lo hago.

Usuario · 04/11/2026 11:44
Sí, siembra datos de demostración en mi cuenta (josep.builds@gmail.com) para que se vea la pantalla 13 con ahorro en pesos: semana 1 y semana 2 con registros inventados y realistas, todo marcado como "Datos de demostración". Usa cifras parecidas a mis entrevistas reales (unos $90–130 de desperdicio en la semana 1 y menos en la semana 2). Cuando acabes, avísame para sacar las capturas.

Claude · 04/11/2026 11:44
Lo planeo así para que funcionen tanto `/ahorro` como `/inicio`. Pongo **hoy (4 nov) como el día 14**: la semana 1 queda del 22 al 28 de oct y la semana 2 del 29 oct al 4 nov. Con eso:
- `/ahorro` compara las dos semanas completas.
- `/inicio` sigue activo, con "Registrar hoy" visible, y hoy queda vacío para que captures las pantallas 9–11 en vivo.

Los artículos tirados llevan "(demo)" en el nombre. No siembro eventos, para no ensuciar la bitácora.

Herramienta: Bash — Seed demo data into founder account
```
mkdir -p db/seeds && cat > db/seeds/demo_josep.sql <<'EOF'
-- DATOS DE DEMOSTRACIÓN (inventados) para la cuenta del fundador, para capturas del persona test.
-- Hoy (2026-11-04, CDMX) = día 14. Semana 1: 22–28 oct. Semana 2: 29 oct–4 nov (hoy vacío).
-- Cifras inspiradas en las entrevistas (desperdicio semana 1 ≈ $90–130). No crea eventos.
-- Se niega a correr si la cuenta ya tiene línea base o registros. Limpieza: db/seeds/demo_josep_cleanup.sql

## 2026-11-04 — Demo data for persona-test screenshots

- Owner asked for invented demo data in the founder account (josep.builds@gmail.com) so `/ahorro` shows a saving
in pesos. Script: `db/seeds/demo_josep.sql`. It refuses to run if the account already has data, and it creates
no events.
- 2026-11-04 = day 14. Week 1 (Oct 22–28): waste $118 + unplanned $247 = $365. Week 2 (Oct 29–Nov 4, today left
empty): waste $52 + unplanned $239 = $291. Saving **$74** → "¡Pasaste la meta!". Baseline: 10 orders, 2 of them
alcohol/tabaco ($315). Waste items carry "(demo)".
- Only valid for screenshots on 2026-11-04. From Nov 5 the account shows "Terminaste tus 14 días".
- Cleanup (back to `/linea-base`): `db/seeds/demo_josep_cleanup.sql`. **Run it before using the account for real
logging.**
- `/ahorro` shows "Semana 2 vs. semana 1" once 7 days are compared (it used to say "Primeros 7 días…").

0479fc4 docs: note demo seed in DECISIONS
```

Claude · 04/11/2026 11:46

Ya puedes sacar las capturas en https://menuyamx.xyz con tu cuenta josep.builds@gmail.com. Los datos solo sirven **hoy, 4 de noviembre**. Desde mañana la cuenta mostrará "Terminaste tus 14 días" y desaparecerán los botones de registro.

Lo que sembré (inventado):

	Comida tirada	Compras no planeadas	Total
Semana 1 (22–28 oct)	$118 (espinaca, tortillas, pollo, jitomates, pan)	$247 (domicilio $189, OXXO $58)

$365 l
l Semana 2 (29 oct–4 nov) l $52 (tortillas, plátanos, crema) l $239 (domicilio $175, OXXO $64) l $291 l

- **Pantalla 13 (`/ahorro`):** "Ahorro esta semana: $74 de $60", barra llena y "¡Pasaste la meta!". Debajo aparece la tarjeta de alcohol/tabaco: 2 pedidos, $315. Verifiqué el $74 con la misma función que usa la app.
- **Línea base:** 10 pedidos parecidos a los de tus entrevistas.
- **Marcas de demo:** los artículos tirados dicen "(demo)" y todas las pantallas ya muestran "Datos de demostración". No agregué eventos, para no ensuciar la bitácora.
- **Hoy está vacío a propósito:** así `/inicio` muestra "Registrar hoy" y puedes capturar las pantallas 9–11 registrando en vivo. Si registras compras hoy, el ahorro baja en tiempo real.
- **Cambio en la app:** `/ahorro` ahora dice "Semana 2 vs. semana 1" cuando compara los 7 días, en vez de "Primeros 7 días…". Ya está desplegado.

Para las capturas:
1. **Botón de $149:** solo aparece si contestaste ELCSA en esa misma pestaña sin recargar. Ve a `/preguntas`, contesta "No" a todo, toca "Continuar" y entra a "Ahorro" desde la barra de abajo. Si recargas, en vez del botón sale "contesta otra vez las 8 preguntas".
2. **Pantallas 7 y 8 (`/linea-base` e inicio vacío):** con datos sembrados ya no se ven. Captúralas con otra cuenta, o primero tomas 9–14 y después corro la limpieza (`db/seeds/demo_josep_cleanup.sql`), que te devuelve a `/linea-base`.
3. **Diferencia con el mockup:** el mockup muestra $48 de $60 (debajo de la meta). Si prefieres que la captura muestre un resultado debajo de la meta, ajusto las cifras.

Antes de usar tu cuenta para registros reales hay que correr la limpieza; lo anoté en `docs/DECISIONS.md`.

Usuario · 04/11/2026 11:55

Ya saqué las capturas, corre la limpieza

Herramienta: Bash — Run demo cleanup and verify account state

```
cat db/seeds/demo_josep_cleanup.sql | grep -v '^--' && supabase db query --linked --project-ref
icohpikxtlqhkpvmvtuv -f db/seeds/demo_josep_cleanup.sql 2>&1 | grep -E "rror|rows" ; supabase db query --linked
--project-ref icohpikxtlqhkpvmvtuv "select (select count(*) from public.menuya_baseline_orders b join auth.users
x on x.id=b.user_id where x.email='josep.builds@gmail.com') baseline, (select count(*) from
public.menuya_waste_logs b join auth.users x on x.id=b.user_id where x.email='josep.builds@gmail.com') waste,
(select count(*) from public.menuya_impulse_logs b join auth.users x on x.id=b.user_id where
x.email='josep.builds@gmail.com') impulse, (select count(*) from public.menuya_profiles b join auth.users x on
x.id=b.user_id where x.email='josep.builds@gmail.com' and consent_at is not null) perfil_con_consentimiento,
(select string_agg(name||':'||c, ', ') from (select name, count(*) c from public.menuya_events e join auth.users
x on x.id=e.user_id where x.email='josep.builds@gmail.com' group by name) s) eventos" 2>&1 | grep -E '"
(baseline|waste|impulse|perfil_con_consentimiento|eventos)"'
```

Resultado

```
delete from public.menuya_waste_logs   where user_id = (select id from auth.users where email =
'josep.builds@gmail.com');
delete from public.menuya_impulse_logs where user_id = (select id from auth.users where email =
'josep.builds@gmail.com');
delete from public.menuya_baseline_orders where user_id = (select id from auth.users where email =
'josep.builds@gmail.com');
  "rows": [],
      "baseline": 0,
      "eventos": "log_added:1, consent_given:1, signed_in:1, pay_link_clicked:1, saving_viewed:3,
elcsa_completed:2",
      "impulse": 0,
      "perfil_con_consentimiento": 1,
      "waste": 0
```

Herramienta: Bash — Note cleanup in decisions and push

```
cat >> docs/DECISIONS.md <<'EOF'
- 2026-11-04: screenshots taken; cleanup ran. Founder account has 0 baseline, 0 waste, 0 impulse rows (back to
`/linea-base`); profile and consent kept. The events from the screenshot session are still there (`log_added` 1,
`saving_viewed` 3, `pay_link_clicked` 1, `elcsa_completed` 2, plus `signed_in`/`consent_given`). Exclude the
founder account when counting real-user metrics.
EOF
git add -A && git commit -q -m "docs: demo cleanup done

```

Resultado

```
425fe21 docs: demo cleanup done
```

Claude · 04/11/2026 11:55

Ya corrí la limpieza. Tu cuenta josep.builds@gmail.com quedó sin línea base y sin registros (0 filas en cada tabla), así que la próxima vez que entres te va a mandar a `/linea-base`. Tu perfil y tu consentimiento siguen igual.

Los eventos de la sesión de capturas siguen en la base, porque la limpieza no los borra:
- `saving_viewed` ×3
- `elcsa_completed` ×2
- `log_added` ×1 (el registro que hiciste en vivo; ese registro ya se borró)
- `pay_link_clicked` ×1
- `signed_in` y `consent_given`

Lo anoté en `docs/DECISIONS.md`: al contar métricas de usuarios reales hay que excluir tu cuenta. Si prefieres que también borre esos eventos para que no cuenten, dímelo.

Usuario · 04/11/2026 12:00

Sí, borra también esos eventos de mi cuenta.

Herramienta: Bash — Delete founder events and record it

```
supabase db query --linked --project-ref icohpikxtlqhkpvmvtuv "delete from public.menuya_events where user_id =
(select id from auth.users where email = 'josep.builds@gmail.com')" 2>&1 | grep -E "rror|rows"; supabase db
query --linked --project-ref icohpikxtlqhkpvmvtuv "select (select count(*) from public.menuya_events e join
auth.users x on x.id=e.user_id where x.email='josep.builds@gmail.com') eventos_cuenta, (select count(*) from
public.menuya_events) eventos_total, (select count(*) from public.menuya_profiles p join auth.users x on
x.id=p.user_id where x.email='josep.builds@gmail.com' and consent_at is not null) perfil_con_consentimiento"
2>&1 | grep -E '"(eventos_cuenta|eventos_total|perfil_con_consentimiento)"'; cat >> docs/DECISIONS.md <<'EOF'
- 2026-11-04: on owner's request, all `menuya_events` rows of the founder account were deleted too (0 left, 0 in
the whole table). Profile + consent kept. Since `elcsa_completed` is gone, the founder account goes through
`/preguntas` again before `/linea-base`. Metrics no longer need to exclude past founder test events.
EOF
git add -A && git commit -q -m "docs: founder test events deleted

Co-Authored-By: Claude Opus 5.5 <noreply@anthropic.com>" && git push -q && git log --oneline -1
```

Resultado

```
  "rows": [],
      "eventos_cuenta": 0,
      "eventos_total": 0,
      "perfil_con_consentimiento": 1
99be699 docs: founder test events deleted
```

Claude · 04/11/2026 12:00

Ya borré todos los eventos de tu cuenta, incluidos `signed_in` y `consent_given`. Tu cuenta tiene 0 eventos y la tabla completa también quedó en 0, así que las métricas empiezan limpias. Tu perfil y tu consentimiento siguen.

Como también se borró `elcsa_completed`, la próxima vez que entres la app te pedirá otra vez las 8 preguntas antes de la línea base. Lo anoté en `docs/DECISIONS.md` y está en GitHub.

— 04/11/2026 12:55 · La conversación se compactó (se acabó el contexto) y continuó en la misma sesión. —

Usuario · 05/11/2026 16:27

Persona test: la confusión más grave fue la pantalla /linea-base (llenar 10 pedidos se siente como tarea, sin saber para qué ni poder saltarla). Arregla SOLO eso:
1. Arriba, una línea que diga para qué sirve, por ejemplo: "Esto nos deja comparar después cuánto ahorraste. Pon solo los que recuerdes."
2. Por defecto muestra 3 renglones, con un botón "+ Agregar otro" (hasta 10).
3. Un botón secundario "Saltar por ahora" que lleve al inicio. En el inicio, un aviso pequeño "Completa tu línea base" hasta que la llene.
Valida igual con zod. Commit "fix: línea base más corta y opcional (persona test)", deploy y anota en

docs/DECISIONS.md que el protocolo pasa de 10 a mínimo 0 / sugeridos 3 pedidos. Dime cuando esté para sacar la captura "después".

Herramienta: Bash — Inspect linea-base files and onboarding

```
git status --short && ls src/app/\(app\)/linea-base src/app/\(app\)/inicio && cat src/app/\(app\)/linea-base/*.tsx src/app/\(app\)/linea-base/*.ts 2>/dev/null; cat src/lib/onboarding.ts; grep -n "baseline" src/lib/validation.ts
```

Resultado

Now the migration (only touches our own `menuya_events` constraint) and the code.

Herramienta: Bash — Apply migration 006 allowing orders=0

```
cat > db/migrations/006_menuya_baseline_skip.sql <<'EOF'
-- MenúYA · 006 · Persona test: la línea base pasa a ser opcional ("Saltar por ahora").
-- Saltar registra baseline_done con orders = 0, que marca el día 1 de la prueba.
-- Solo cambia el check de props de menuya_events (nada de mapa-tandeo).

alter table public.menuya_events drop constraint if exists menuya_events_props_allowed;
alter table public.menuya_events add constraint menuya_events_props_allowed check (
  props - array['type','week','orders'] = '{}'::jsonb
  and (not props ? 'type'   or props->>'type' in ('waste','impulse','nothing'))
  and (not props ? 'week'   or props->'week' in ('1'::jsonb, '2'::jsonb))
  and (not props ? 'orders' or props->'orders' in ('0','1','2','3','4','5','6','7','8','9','10'))
);
EOF

Casi listo. Una prueba cuenta los lugares donde se escribe cada evento, y ahora `baseline_done` tiene dos (guardar y saltar). Estoy ajustando esa prueba.

Herramienta: Bash — Read event write-point test

```
sed -n 55,80p tests/elcsa.test.ts
```

Resultado

```
});

test("11A.4: ELCSA no usa red ni almacenamiento; la acción del servidor no recibe argumentos", () => {

Las 21 pruebas pasan. Ahora anoto la decisión, hago commit y deploy.

Herramienta: Bash — Update DECISIONS, commit and push

```
cat >> docs/DECISIONS.md <<'EOF'

## 2026-11-05 · Fix del persona test: línea base más corta y opcional

- **Hallazgo (persona test, 11B):** la confusión más grave fue `/linea-base`. Llenar 10 pedidos se sentía como
tarea, sin saber para qué ni poder saltarla.
- **Cambio de protocolo:** la línea base pasa de **10 pedidos obligatorios** a **mínimo 0 / sugeridos 3 / máximo
10**.
- **Pantalla:**
  - Arriba dice para qué sirve: "Esto nos deja comparar después cuánto ahorraste. Pon solo los que recuerdes."
  - Muestra 3 renglones; "+ Agregar otro" agrega uno más, hasta 10.
  - Botón secundario "Saltar por ahora", que lleva a `/inicio`.
- **Inicio:** muestra el aviso "Completa tu línea base →" hasta que haya al menos un pedido guardado.
- **Validación:** igual con zod (`baselineSchema`, 1–10 filas con etiqueta válida y monto válido). Guardar con 0
filas da el error "Llena al menos un pedido, o toca «Saltar por ahora»". "Mínimo 0" se cumple con el botón de
saltar, no guardando un formulario vacío.
- **Día 1 de la prueba:** ahora es la fecha del primer `baseline_done` (al guardar o al saltar) o del primer
pedido de línea base, la que sea más antigua. Saltar registra `baseline_done` con `orders: 0`.
- **Migración 006** (`db/migrations/006_menuya_baseline_skip.sql`): el check `menuya_events_props_allowed`
acepta `orders` 0–10. Solo toca `menuya_events`; mapa-tandeo no se tocó. El zod de `src/lib/events.ts` cambió
igual (0–10).
- **Efecto en el análisis:** quien salta no tiene línea base. Ese usuario no ve la tarjeta de alcohol/tabaco, y
el ahorro (semana 1 vs. semana 2) no depende de la línea base, así que no cambia. En métricas, contar
`baseline_done` con `orders = 0` como "saltó".

Claude · 05/11/2026 16:36

La pantalla `/linea-base` ya es más corta y se puede saltar; está publicada en menuyamx.xyz, así que ya puedes sacar la captura "después". Las 21 pruebas unitarias y las 33 revisiones del smoke test contra producción pasan. No probé la pantalla con sesión iniciada; lo que vas a ver lo sé por el código.

- **Para qué sirve:** arriba aparece en un recuadro amarillo "Esto nos deja comparar después cuánto ahorraste. Pon solo los que recuerdes." El título ahora es "Tus últimos pedidos" (ya no dice 10).
- **3 renglones:** la pantalla abre con 3, y "+ Agregar otro" agrega uno a la vez hasta 10.
- **"Saltar por ahora":** es un botón secundario que lleva al inicio. Ahí aparece un aviso pequeño, "Completa

tu línea base →", que lleva a `/linea-base` y desaparece cuando guardas al menos un pedido.
- **Validación:** sigue con zod igual que antes. Si tocas "Guardar y empezar" sin llenar nada, sale el mensaje "Llena al menos un pedido, o toca «Saltar por ahora»".

Para que se pueda saltar cambié dos cosas más:
- **Cambio en la base de datos:** apliqué una migración nueva que solo toca la tabla `menuya_events`, para aceptar el valor 0 en el número de pedidos. No toqué nada de mapa-tandeo.
- **Día 1 de la prueba:** antes era el día en que llenabas la línea base; ahora también cuenta el día en que la saltas. Saltar se guarda como `baseline_done` con 0 pedidos, para contarlo después en las métricas.

Lo anoté en `docs/DECISIONS.md`, incluido el cambio de protocolo de 10 pedidos a mínimo 0 / sugeridos 3. El commit es `d631420`.

Para la captura: como borramos los eventos de tu cuenta, al entrar te tocan otra vez las 8 preguntas y luego llegas a la nueva `/linea-base`. Si tocas "Guardar" o "Saltar", ya no vuelves a esa pantalla. Saca la captura antes, o después desde el aviso del inicio si saltaste.
